CERTIFICATE OF CALIBRATION

Certificate Number:

Ricardo Energy \& Environment ID:

6198

ED1194/6198

The gaseous ambient analysers listed above have been tested for zero response, calibration factor, linearity and converter efficiency (NOx analysers) by documented methods. The factors have been calculated using certified gas standards. The particulate analysers listed above have been tested for sample flow rates and k0 (where appropriate) by documented methods. Note that the test results are valid on the day of test only, as analyser drift over time cannot be quantified. All results for gaseous species are reported in concentration units of $\mathrm{nmol} / \mathrm{mol}$ or $\mu \mathrm{mol} / \mathrm{mol}$.
${ }^{1}$ The zero response is the zero reading on the data logging system of the analyser when audit zero gas was introduced to the analysers under test.
${ }^{2}$ The calibration factor is the multiplying factor required to scale the reading on the data logging system of the analyser into reported concentration units ( $\mathrm{nmol} / \mathrm{mol}$ for $\mathrm{NO}, \mathrm{NOx}, \mathrm{SO} 2, \mathrm{O} 3$ and $\mu \mathrm{mol} / \mathrm{mol}$ for CO ). It should be used in conjunction with the zero response. A corrected concentration is calculated using the following equation:

Concentration = F(Output - Zero Response)
Where $F=$ Calibration Factor provided on this certificate
Output = Reading on the data logging system of the analyser
Zero Response = Zero Response provided on this certificate
${ }^{3}$ Converter eff. is the measured efficiency of the NO 2 to NO converter within the oxides of nitrogen analyser under test
${ }^{4}$ The measured main flow rate (where this is applicable) is the flow rate through the sensor unit of the TEOM particulate analyser under test. The measured aux flow rate (where this is applicable) is the flow rate through the bypass tubing of the TEOM particulate analyser under test. The measured total flow rate is the total flow rate through the particulate analyser under test. Units of flow are I.min-1, reported at prevailing ambient conditions unless otherwise specified. Where flow rates are highlighted in bold, it indicates that measurements were not made at the analyser sample inlet. These measurements therefore may not accurately reflect analyser performance in normal operation.
${ }^{5}$ The calculated ko value (specifically for TEOM analysers) is the calculated ko spring constant based on tests undertaken with filters of known weight. The \% deviation indicates the closeness of the calculated result to the manufacturer's specified value of ko.

The calibration results shaded are those that fall within our scope of accreditation, all other results on this certificate are not UKAS accredited, but have been included for completeness.
