Approved Signatories:			S. Eaton D Hector N Rand B Davies	│ │ B Stacey │ │ S Stratton │ ✓ │ S Telfer │ ☐ S Gray			
Signed:	Stelke						
Date of issue:	07 April 2022						
Certificate Number:	5796						
Customer Name and Address:			ils and Flooding D I Quality Directora				
Description:		Calibration factors for the air monitoring station(s) at West Lothian Council					
Ricardo Energy & Environment ID:		ED11194 / 5796					
The reported expanded uncertainties are based on a level of confidence of approximately 95% The uncer requirements. This certificate is issued in accordance with the labo Service. It provides traceability of measurement to National Physical Laboratory or other recognised nathan in full, except with the prior written approval of the prior written approval of the service.	rainty evaluation has been carried out ratory accreditation requirements of t the SI system of units and/or to units o titional metrology institutes. This certifi	in accordance with UKA he United Kingdom Acc f measurement realised	reditation

CERTIFICATE OF CALIBRATION

Page 3 of 3

Date of issue: 07 April 2022

Certificate Number: 5796

Ricardo Energy & Environment ID: ED11194 / 5796

The gaseous ambient analysers listed above have been tested for zero response, calibration factor, linearity and converter efficiency (NOx analysers) by documented methods. The factors have been calculated using certified gas standards. The particulate analysers listed above have been tested for sample flow rates and ko(where appropriate) by documented methods. Note that the test results are valid on the day of test only, as analyser drift over time cannot be quantified. All results for gaseous species are reported in concentration units of nmol/mol or µmol/mol.

Concentration = F(Output - Zero Response)

Where F = Calibration Factor provided on this certificate

Output = Reading on the data logging system of the analyser

Zero Response = Zero Response provided on this certificate

The calibration results shaded are those that fall within our scope of accreditation, all other results on this certificate are not UKAS accredited, but have been included for completeness.

ee.**ricardo**.com

¹ The zero response is the zero reading on the data logging system of the analyser when audit zero gas was introduced to the analysers under test.

² The calibration factor is the multiplying factor required to scale the reading on the data logging system of the analyser into reported concentration units (nmol/mol for NO, NOx, SO2, O3 and µmol/mol for CO). It should be used in conjunction with the zero response. A corrected concentration is calculated using the following equation:

³ Converter eff. is the measured efficiency of the NO₂ to NO converter within the oxides of nitrogen analyser under test.

⁴ The measured main flow rate (where this is applicable) is the flow rate through the sensor unit of the TEOM particulate analyser under test. The measured total flow rate is the total flow rate through the particulate analyser under test. Units of flow are l.min⁻¹, reported at prevailing ambient conditions unless otherwise specified. Where flow rates are highlighted in bold, it indicates that measurements were not made at the analyser sample inlet. These measurements therefore may not accurately reflect analyser performance in normal operation.

⁵ The calculated ko value (specifically for TEOM analysers) is the calculated ko spring constant based on tests undertaken with filters of known weight. The % deviation indicates the closeness of the calculated result to the manufacturer's specified value of ko.
