

Air Quality Action Plan 2011

Executive Summary

Introduction

Following the recent declaration of two Air Quality Management Areas (AQMAs), Aberdeen City Council (ACC) had a statutory duty under the Local Air Quality Management (LAQM) framework to produce this Air Quality Action Plan (AQAP). The aim of the AQAP is to describe the measures that ACC will take to improve air quality in Aberdeen, particularly in the two recently declared AQMAs and the City Centre AQMA that was originally declared in 2001. This AQAP supersedes the 2006 AQAP.

It is necessary to improve air quality in Aberdeen to protect the health of the city's inhabitants.

ACC commissioned AECOM to assist with the production of the AQAP.

Why has this AQAP been produced?

ACC undertakes monitoring of the main local air pollutants associated with urban areas: nitrogen oxides (NO_x; consisting of nitrogen oxide (NO) and nitrogen dioxide (NO₂)) and fine particulate matter ($PM_{2.5}$ and PM_{10}). The results of the monitoring clearly indicate that health based national objectives and statutory European limits are being exceeded in the City. Predictive modelling studies have also been used to better understand the spatial extent of the problem, and to help determine likely pollutant concentrations in the future.

Based on the monitoring and modelling work undertaken by the Council, several areas have been identified as unlikely to be meeting national objectives and European limits, and hence the Council have declared AQMAs. The air quality problem in Aberdeen is predominantly a result of emissions from road vehicles, as is the case elsewhere in the UK, and this is reflected in the locations of the AQMAs:

- **City Centre** (originally declared in 2001, last amended in 2005; including Union Street, Market Street, Virginia Street, Commerce Street, and parts of Holburn Street, Guild Street and King Street)
- Anderson Drive (declared December 2008, incorporating the whole of Anderson Drive and the area around the Haudagain roundabout); and
- Wellington Road (declared December 2008, from the Queen Elizabeth II Bridge to Balnagask Road)

Maps of the AQMAs are provided in Appendix 1.

The national air quality objectives and statutory European air quality limit values that are currently being exceeded or at risk of being exceeded are the:

- NO₂ annual and hourly mean; and
- PM₁₀ annual and daily mean (national objectives only);

The aim of the AQAP is to describe the measures that ACC will take to improve air quality in Aberdeen, particularly with regard to the two recently declared AQMAs and the city centre AQMA that was originally declared in 2001. The main pollutants of concern in Aberdeen, NO_2 and fine particulate matter, are known to have an adverse effect on health; studies have demonstrated that poor air quality is estimated on average to reduce the life expectancy of each person in the UK by an average of 7-8 months with estimated annual health costs of up to £20 billion (HMSO, 2007). Therefore it is necessary to improve air quality in Aberdeen to protect the health of the City's inhabitants.

Concentrations well in excess of the relevant objectives and limit values have been measured, particularly within parts of the City Centre AQMA (such as Union Street and Market Street), but also at the north end of the Anderson Drive AQMA (around Haudagain roundabout). It is clear that bold and far reaching measures, on a range of fronts, will be necessary to reduce these pollutants to ensure compliance.

Air Quality Action Plan Measures

A large number of potential measures to improve air quality have been discussed and analysed as part of the process of producing this AQAP. An initial consultation event was held in October 2009 to get the views of a wide range of interested

bodies, businesses and groups. The measures that were identified have been considered in terms of their potential air quality impact, practicality, feasibility, public acceptability, cost, and other environmental and social factors.

The result of the process is the following list of measures. The majority are concerned with reducing the impact of transport emissions, identified as the main cause of the air quality problem in Aberdeen. The list is long; this is a reflection of the fact that action is required on as wide a range of initiatives as possible to address the air quality problem. The measures have been grouped into 6 categories

| Ref. | Measure |
|------|---|
| 1 | MODAL SHIFT & INFLUENCING TRAVEL CHOICE |
| 1.1 | Increase Bus Use |
| 1.2 | Improve Cycling & Walking Provision |
| 1.3 | Travel Plans |
| 1.4 | Improve public awareness of air quality issues |
| 1.5 | Car Clubs / Car Pool Schemes |
| 1.6 | Crossrail |
| 1.7 | Rail Freight |
| 2 | LOWER EMISSIONS & CLEANER VEHICLES |
| 2.1 | Green Vehicle procurement & Fuel/Charging Infrastructure |
| 2.2 | Eco-driving |
| 2.3 | Emissions Testing & Idling Enforcement |
| 2.4 | Taxis |
| 2.5 | Low Emission Zone |
| 3 | ROAD INFRASTRUCTURE |
| 3.1 | Pedestrianisation |
| 3.2 | Road Building / Junction Alterations |
| 4 | TRAFFIC MANAGEMENT |
| 4.1 | Intelligent Transport System (ITS) |
| 4.2 | High Occupancy Vehicle (HOV) Lane |
| 4.3 | Freight and Commercial Vehicle Access |
| 5 | PLANNING & POLICIES |
| 5.1 | Produce Supplementary Planning Guidance |
| 5.2 | Integration of AQAP with Local Transport Strategy (LTS) and Regional Transport Strategy (RTS) |
| 5.3 | Integration of AQAP with Health and Transport Action Plan (HTAP) |
| 5.4 | Road Hierarchy |
| 5.5 | Car Parking Policies |
| 5.6 | National Lobbying |
| 6 | NON-TRANSPORT MEASURES |
| 6.1 | Control Biomass Installations |
| 6.2 | Industry Permitting |
| 6.3 | Tree Planting |
| 6.4 | Shipping |

Consultation

The Draft Quality Action Plan was released for consultation in October 2010. ACC will now ensure that the measures are implemented, taking account of the response and comments received. ACC continues to welcome any further comments on the Plan, or on air quality in general at any stage over the coming years, and wish to thank all those who have contributed during the consultation period.

1 Introduction

Following the recent declaration of two Air Quality Management Areas (AQMAs), Aberdeen City Council (ACC) had a statutory duty under the Local Air Quality Management (LAQM) framework to produce an Air Quality Action Plan (AQAP). The aim of the AQAP is to describe the actions that ACC will take to improve air quality in Aberdeen, particularly in the two recently declared AQMAs and the City Centre AQMA that was originally declared in 2001.

It is necessary to improve air quality in Aberdeen to protect the health of the City's inhabitants.

ACC commissioned AECOM to assist with the production of the AQAP.

1.1 Why has this AQAP been produced?

ACC undertakes monitoring of the main local air pollutants associated with urban areas: nitrogen oxides (NO_x; consisting of nitrogen oxide (NO) and nitrogen dioxide (NO₂)) and fine particulate matter ($PM_{2.5}$ and PM_{10}). The results of the monitoring clearly indicate that health based national objectives and statutory European limits are being exceeded in the City. Predictive modelling studies have also been used to better understand the spatial extent of the problem, and to help determine likely pollutant concentrations in the future.

Based on the monitoring and modelling work undertaken by the Council, several areas have been identified as unlikely to be meeting national objectives and European limits, and hence the Council have declared AQMAs. The air quality problem in Aberdeen is predominantly a result of emissions from road vehicles, as is the case elsewhere in the UK, and this is reflected in the locations of the AQMAs:

- **City Centre** (originally declared in 2001, last amended in 2005; including Union Street, Market Street, Virginia Street, Commerce Street, and parts of Holburn Street, Guild Street and King Street)
- Anderson Drive (declared December 2008, incorporating the whole of Anderson Drive and the area around the Haudagain roundabout); and
- Wellington Road (declared December 2008, from the Queen Elizabeth II Bridge to Balnagask Road)

Maps of the AQMAs are provided in Appendix 1.

The aim of the AQAP is to describe the actions that ACC will take to improve air quality in Aberdeen, particularly in the two recently declared AQMAs and the City Centre AQMA that was originally declared in 2001. The main pollutants of concern in Aberdeen, NO_2 and fine particulate matter, are known to have an adverse effect on health; studies have demonstrated that poor air quality is estimated on average to reduce the life expectancy of each person in the UK by an average of 7-8 months with estimated annual health costs of up to £20 billion (HMSO, 2007). Therefore it is necessary to improve air quality in Aberdeen to protect the health of the City's inhabitants.

Concentrations well in excess of the relevant objectives and limit values have been particularly measured within parts of the City Centre AQMA (such as Union Street and Market Street), but also at the north end of the Anderson Drive AQMA (around Haudagain roundabout). It is clear that bold and far reaching measures, on a range of fronts, will be necessary to reduce these pollutants to ensure compliance. The source apportionment studies that have been undertaken show that the source of the problem varies depending up on the proportions of various vehicle types and the pollutant in question. For instance on Union Street, buses contribute to the ambient NO_2 concentrations to the greatest extent, whereas for Wellington Road, HGVs are the main source of the raised pollution levels. When comparing the pollutants, cars are comparatively more important emitters of PM_{10} than NO_x .

1.2 Description of Local Authority Area

Aberdeen is situated on the east coast of Scotland by the North Sea and has a population of approximately 220,000. The City acts as a focus for employment, service and leisure activities both for residents of Aberdeen and the surrounding area.

There is little heavy industry within the City and much of the economy is based around services to the oil industry. Road traffic is the main source of atmospheric pollution. Aberdeen's road transportation system is constrained by the River Dee to the south of

the City and the River Don to the north therefore there are limited routes to either arrive at or pass around the city. Following consideration of the Public Local Inquiry Reporters' Report the Scottish Ministers announced their decision to proceed with the Aberdeen Western Peripheral Route (AWPR) on 21 December 2009. The relevant AWPR Schemes and Orders were approved by resolution of the Scottish Parliament on 3 March 2010. In May 2010 Legal challenges were submitted to the Court of Session challenging the decision of the Scottish Ministers to proceed with the project and the making of the Schemes and Orders. Subject to completing the necessary statutory procedures it had been hoped to start construction of the AWPR in 2011. However the legal challenges will significantly delay construction until they have been heard in the Court of Session and resolved. Assuming that the applications to the Court are not successful, then a thorough review of the remaining stages of the project will need to be carried out before issuing a definitive timetable to construction. It should be noted that the Scottish Government has reaffirmed their commitment to delivering the Aberdeen Western Peripheral Route and to the project being completed as soon as possible.

The A90 and A96 trunk roads, A93 North Deeside Road, A90 Ellon Road and A956 Wellington Road are the most significant routes to converge or pass through the City Centre. Much of the commuter traffic entering the City comes from neighbouring Aberdeenshire.

Aberdeen Harbour is located in the City Centre and is a thriving environment acting as the UK's main base for supply vessels to offshore installations. There is also a daily fish market and regular ferries to Shetland and Orkney Islands. Aberdeen Airport (Dyce) is located around 7 km to the northwest of the City.

1.3 Consultation

The Draft Quality Action Plan was released for consultation in October 2011. Section 5.5 provides further information relating to the responses and comments received. ACC will now ensure that the measures are implemented, taking account of the response and comments received. ACC continues to welcome any further comments on the Plan, or on air quality in general at any stage over the coming years, and wish to thank all those who have contributed during the consultation period.

1.4 Report Structure

The remainder of the report is structured as follows:

- Section 2 provides an overview of relevant air quality legislation and guidance and a summary of the pollutants which are of concern;
- Section 3 contains background to the air quality problem in Aberdeen, including a review of the reports that ACC have produced under the LAQM framework, and a review of pollutant monitoring results in the city;
- Section 4 discusses the approach taken in developing this AQAP;
- Section 5 summarises the results of the appraisal of the various actions to improve air quality;

- Section 6 summarises the outcomes of the appraisal and discusses the necessary steps towards ensuring the actions within this plan are implemented;
- References are then provided; and finally the
- Appendices contain additional figures and information referred to within the body of the report.

2 Legislative Context

2.1 Policy Context/Framework

2.1.1 Overview of Recent Air Quality Legislation and Policy

The provisions of Part IV of the Environment Act 1995 (Environment Act Part IV, 1995) establish a national framework for air quality management, which requires all local authorities in England, Scotland and Wales to conduct local air quality reviews. Section 82(1) of the Act requires these reviews to include an assessment of the current air quality in the area and the predicted air quality in future years. Should the reviews indicate that the standards prescribed in the Air Quality Strategy (HMSO, 2007) will not be met, the local authority is required to designate an Air Quality Management Area (AQMA). Action must then be taken at a local level to ensure that air quality in the area improves.

2.1.2 The Air Quality Strategy

The Air Quality Strategy identifies several ambient air pollutants that have the potential to cause harm to human health. These pollutants are associated with local air quality problems, with the exception of ozone, which is recognised as being a regional problem.

The Air Quality Strategy sets standards for the pollutants that are associated with local air quality. These objectives aim to reduce the health impacts of the pollutants to negligible levels. The most important pollutants with regard to road traffic are nitrogen dioxide (NO₂) and particulate matter of under 10 μ m in diameter (PM₁₀).

The following guidance and strategic documents are important with regard to air quality:

- The technical and policy guidance notes, LAQM.TG(09) and LAQM.PG(S)(09), issued by the Government to assist local authorities in their Local Air Quality Management responsibilities (Defra, 2009a,b);
- 'Development Control: Planning for Air Quality', published by the National Society for Clean Air and Environmental Protection (NSCA, 2006). (It should be noted that the NSCA are now known as Environmental Protection UK (EPUK));
- Planning Advice Notice 51 (PAN 51): Planning Environmental Protection and Regulation (Scottish Executive, 2006).
- Institute of Air Quality Management (IAQM), Position on the Description of Air Quality Impacts and the Assessment of their Significance, (IAQM, 2009)
- LAQM Low Emission Zone Guidance, (The Scottish Government, 2009); and
- Low Emissions Strategies: using the planning system to reduce transport emissions (Defra, 2010).

2.2 Pollutants of Concern

2.2.1 Nitrogen Dioxide

The Government and the Devolved Administrations adopted two Air Quality Objectives for nitrogen dioxide (NO₂) to be achieved by the end of 2005. In 2010, mandatory EU air quality limit values on pollutant concentrations will apply in the UK. The EU limit values for NO₂ are the same as the national objectives for 2005 (HMSO, 2007):

- An annual mean concentration of 40 µg/m³; and
- An hourly mean concentration of 200 µg/m³, to be exceeded no more than 18 times per year.

In practice, meeting the annual mean objective has been and is expected to be considerably more demanding than achieving the 1-hour objective. The annual mean objective of $40 \ \mu g/m^3$ is currently widely exceeded at roadside sites throughout the UK, with exceedences also reported at urban background locations in major conurbations.

There is considerable year-to-year variation in the number of exceedences of the hourly objective, driven by meteorological conditions which give rise to winter episodes of poor dispersion and summer oxidant episodes. Analysis of the relationship between 1-hour and annual mean NO_2 concentrations at roadside and kerbside monitoring sites indicate that exceedences of the 1-hour objective are unlikely where the annual mean is below 60 µg/m³ (AEA, 2008). Exceptions were found to be related to a regional pollutant event in December 2007.

 NO_2 and nitric oxide (NO) are both oxides of nitrogen, and are collectively referred to as NO_X . All combustion processes produce NO_X emissions, largely in the form of NO, which is then converted to NO_2 , mainly as a result of its reaction with ozone in the atmosphere. Therefore the ratio of NO_2 to NO is primarily dependent on the concentration of ozone and the distance from the emission source.

In addition, in recent years a trend has been noted whereby NO_2 concentrations have been increasing at certain roadside monitoring sites, despite emissions of NO_X falling. The 'direct NO_2 ' phenomenon is having an increasingly marked effect at many urban locations around the country and must be considered when undertaking modelling studies and in the context of future local air quality strategy.

2.2.2 Particulate Matter

This assessment considers the annual mean and daily mean air quality standards, as specified in the Air Quality Strategy for England, Scotland, Wales and Northern Ireland, (HMSO, 2007). Two objectives have been adopted for PM₁₀, to be achieved by the end of 2010:

- An annual mean concentration of 18 g/m³ (gravimetric); and
- A 24-hour mean concentration of 50 g/m³ (gravimetric) to be exceeded no more than 7 times per year.

Particulate matter is composed of a wide range of materials arising from a variety of sources, and is typically assessed as total suspended particulates or as a mass size fraction. National and European Objectives/Limit Values apply for the PM_{10} fraction and national objectives also apply for the $PM_{2.5}$ fraction. These express particulate levels as the total mass size fraction at or below an aerodynamic diameter of 10 and 2.5 m respectively.

Both short-term and long-term exposure to ambient levels of particulate matter are consistently associated with respiratory and cardiovascular illness and mortality as well as other ill-health effects. Particles of less than 10 m in diameter have the greatest likelihood of reaching the thoracic region of the respiratory tract.

It is not currently possible to discern a threshold concentration below which there are no effects on the whole population's health. Recent reviews by WHO and the Committee on the Medical Effects of Air Pollutants (COMEAP, 1998) have suggested exposure to a finer fraction of particles ($PM_{2.5}$, which typically make up around two thirds of PM_{10} emissions and concentrations) give a stronger association with the observed ill health effects, but also warn that there is evidence that the coarse fraction (between $PM_{10} - PM_{2.5}$) also has some effects on health.

Emissions of PM_{10} have decreased considerably since 1970, mainly due to the decline in coal use and the result of legislative and technical control of emissions from both road traffic and industrial sources. Industrial processes and road transport were the main sources of PM_{10} in 2005. In general diesel vehicles emit a greater mass of particulate per vehicle kilometre than petrolengine vehicles (AEA, 2007).

3 Air Quality in Aberdeen

3.1 Local Air Quality Management

An Air Quality Management Area (AQMA) has been in place in the centre of Aberdeen since June 2001, centred on Union Street and Market Street as a result of past and predicted exceedences of the annual mean NO₂ objective (ACC, 2009). The AQMA was extended in 2003 and again amended in 2005 to include adjoining roads. The 2004 Detailed Assessment (ACC, 2004) indicated that 2010 Scottish objectives for PM_{10} may be exceeded in the City Centre, and an AQMA was declared for the pollutant covering the same area as for NO₂.

The 2006 Updating and Screening Assessment (ACC, 2006) found that NO₂ and PM₁₀ levels were similar to previous years within the AQMA. Potential exceedences of PM₁₀ were identified along the east coast and close to major roads, whilst diffusion tube measurements of NO₂ suggested that there may be potential exceedences of the annual mean along commuter routes. The 2007 progress report indicated that there was a risk of exceeding the annual mean NO₂ objective outside of the existing AQMA, in the following areas:

- South Anderson Drive / Anderson Drive / North Anderson Drive (A90);
- Great Northern Road / (St Machar Drive Auchmill Road) / Auchmill Road (A96);
- King Street (A956); and
- Wellington Road (A956).

A Detailed Assessment was undertaken for these four areas for both NO₂ and PM₁₀ (ACC, 2008a). The assessment also considered projected scenarios with and without the AWPR. The Detailed Assessment concluded that exceedences of the annual mean objectives for NO₂ and PM₁₀ were likely at the Haudagain roundabout (A90/A96) and Wellington Road (Queen Elizabeth II Bridge to Balnagask Road) in 2010 without the AWPR. Exceedences were predicted in 2010 on Wellington Road with the AWPR, whilst concentrations were predicted to be slightly below the objective with the AWPR at the Haudagain roundabout. Since the AWPR will not be operational until a future date still to be determined, as a result of on-going legal challenges, it was considered prudent to declare AQMAs for NO₂ and PM₁₀ in both areas, and along the length of Anderson Drive.

The 2009 Further Assessment (ACC, 2009b) considered the new Anderson Drive and Wellington Road AQMAs corridors in light of further traffic data and monitoring data; no changes were proposed to the AQMAs.

In support of this document, ACC commissioned a modelling study focussing on NO_2 and PM_{10} concentrations in the City Centre AQMA and surrounding roads (ACC, 2010).

In summary, based on the work undertaken by ACC, several areas have been identified in the past decade as unlikely to be meeting national objectives and European limits, and hence the Council have declared AQMAs. As is the case elsewhere in the UK, the air quality problem in Aberdeen is predominantly a result of emissions from road vehicles, and this is reflected in the locations of the AQMAs:

- **City Centre AQMA** (originally declared in 2001, last amended in 2005; including Union Street, Market Street, Virginia Street, Commerce Street, and parts of Holburn Street, Guild Street and King Street);
- Anderson Drive AQMA (declared December 2008, incorporating the whole of Anderson Drive and the area around the Haudagain roundabout); and
- Wellington Road AQMA (declared December 2008, from the Queen Elizabeth II Bridge to Balnagask Road).

Whilst exceedences of the annual mean objectives are more widespread for PM_{10} than for NO_2 , the Scottish annual mean PM_{10} objective is not mandatory, whereas the NO_2 annual mean EU limit value is mandatory and legally binding. There are, however, less stringent mandatory EU objectives for PM_{10} . Levels of PM_{10} , particularly around the Market Street area, are at risk of exceeding the EU objective.

During 2010, ACC will undertake a review of the boundaries of its AQMAs, based primarily on the latest pollutant monitoring results, and recent modelling studies. ACC has also secured funding to undertake a Low Emission Zone feasibility study, which is currently underway.

7

3.2 Pollutant Monitoring

3.2.1 NO₂ Monitoring

Automatic monitoring of NO₂ has been undertaken at six sites in Aberdeen in recent years:

- Market Street: a City Centre kerbside site (within existing AQMA);
- Union Street: a City Centre roadside site (within existing AQMA);
- Errol Place: an urban background site close to the City Centre;
- Anderson Drive: a roadside site between Headland Court and Broomhill Road (within the new AQMA);
- Wellington Road: a roadside site (within the new AQMA); and
- King Street: a kerbside site (to the north of the City Centre AQMA)

Monitoring began at the Errol Place station in 1999, Union Street and Market Street in 2000, Anderson Drive in 2005, Wellington Road in 2008, and King Street in 2009. The Market Street monitoring site was removed in October 2008 due to the redevelopment of the adjoining area and relocated to a site approximately 400m to the south of the original site.

Data and statistics are reported annually by ACC through the LAQM process (refer to ACC Updating and Screening Assessments and Progress Reports (e.g. ACC, 2009 and ACC, 2008)). However the monitoring data since 2003 at these sites can be summarised as follows:

- The highest concentrations, in excess of the mandatory EU limit values have been recorded at the Market Street and Union Street sites:
 - At the Market Street roadside site, concentrations increased considerably between 2006 and 2008 (from approximately 55 to 73 g/m³), prior to its decommissioning; this increase was attributed in the main to considerable construction activity in the vicinity of the site. Market Street is a heavily trafficked route, with a particularly high proportion of HGVs;
 - At the Union Street roadside site, concentrations have fluctuated between approximately 48 and 64 g/m³, with no obvious trends emerging. Union Street is the main shopping street in Aberdeen, through which almost all bus routes pass;
 - Exceedences of the hourly limit value have also been recorded at both Union Street and Market Street;
- At the Anderson Drive roadside site, concentrations have fluctuated between approximately 23 and 28 g/m³, with no obvious trends emerging;
- Early data from the Wellington Road site indicate concentrations of NO₂ around the EU Limit value of 40 g/m³; and
- At the urban background Errol Place site concentrations have fluctuated between approximately 23 and 30 g/m³, with no obvious trends emerging.

There is also a network of passive diffusion tubes located across the City measuring concentrations of NO₂. Annual mean concentrations up to 80 g/m^3 , double the annual mean EU limit value have been measured, but again no obvious annual trends emerge.

3.2.2 PM₁₀ Monitoring

Continuous monitoring of PM_{10} is undertaken at the same sites as for NO_2 . The monitoring data since 2003 at these sites can be summarised as follows:

- Concentrations in excess of the annual mean Scottish 2010 objective (18 g/m³) were recorded at all sites;
- At the Market Street roadside site, concentrations in excess of the 2004 annual and daily mean objective (of 40 g/m³) have been recorded; concentrations increased considerably between 2006 and 2008 (from approximately 50 to 85 g/m³), attributed to considerable construction activity in the vicinity of the site;
- At the Union Street roadside site, concentrations have fluctuated between approximately 19 and 25 g/m³, with no obvious trends emerging. Union Street is the main shopping street in Aberdeen, through which almost all bus routes pass;
- At the Anderson Drive roadside site, concentrations have fluctuated between approximately 17 and 18 g/m³;
- Early data from the Wellington Road site indicate concentrations of PM₁₀ around 25 g/m³; and

8

At the urban background Errol Place site concentrations have fluctuated between approximately 17 and 22 μg/m³, with no obvious trends emerging.

It is very important to note that PM_{10} concentrations at the urban background site have consistently been higher than those at the roadside Anderson Drive site. This 'anomaly' is likely to be due to coastal influences (sea salt). ACC will be undertaking a monitoring study during 2010 to investigate in further detail the 'coastal' contribution to the PM_{10} fraction.

The values quoted above were derived from TEOM data using a correction factor of 1.3; if the 1.14 factor had been used lower values would have been reported.

3.3 Modelling Studies

ACC have undertaken recent dispersion modelling studies, focusing on the three AQMAs, and the pollutants NO_2 and PM_{10} . The 2009 Further Assessment (ACC, 2009b) examined the Anderson Drive and Wellington Road AQMAs, and the 2010 City Centre modelling study (ACC, 2010) focussed on the City Centre AQMA and surrounding roads. Further details regarding the studies are provided in the reports. These studies involved analyses of the source contribution to the overall concentrations, and estimations of the numbers of properties affected.

3.3.1 Source Apportionment

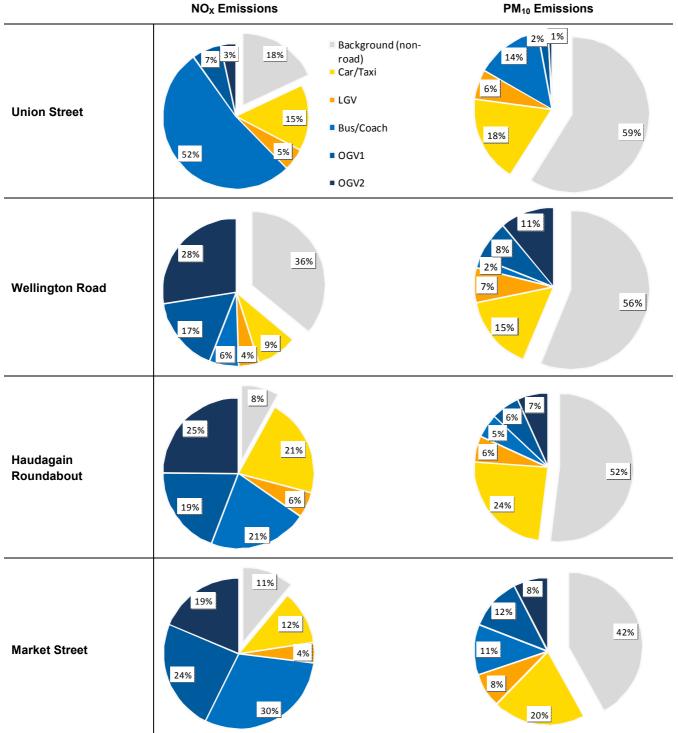

Table 1 contains the source apportionment information for four roads/areas, where the highest concentrations have been predicted within the three AQMAs. The same information is provided in graphical form in Figure 1.

The contribution from traffic is provided, and compared with the background source contributions (i.e. all other sources). The contribution from different vehicle types is also provided (these have been calculated using the February 2010 version of the Emissions Factor Toolkit (v4.1)).

| Road | Source | NOx | PM ₁₀ | Traffic Source Breakdown | | | | | | |
|-----------------|--------------|-------|-------------------------|--------------------------|-----|--------------|-------------------|--|--|--|
| Rudu | Contribution | NOX | F 1 V 110 | Vehicle Type | NOx | PM 10 | PM _{2.5} | | | |
| | | | | Car/Taxi | 18% | 44% | 40% | | | |
| | Background | 18% | 59% | LGV | 6% | 15% | 15% | | | |
| Union St | - | | | Bus/Coach | 65% | 34% | 37% | | | |

Table 1: Source Apportionment

The following observations can be made:

- For NO_X, road traffic is the greatest single contributor, whereas for PM₁₀ background sources account for the greatest proportion of total emissions.
- With regards to NO_X, cars, despite making up the greatest proportion of the traffic, are generally responsible for the least emissions. However for PM₁₀, cars are responsible for a far greater proportion of the total emissions.
- The results for Union Street indicate that for NO_X, buses are the single greatest contributor (65%), but for PM₁₀ the bus contribution is smaller (34%), and the car contribution is greatest (44%).
- For Wellington Road, HGV emissions (OGV1 and OGV2) contribute to the greatest extent, and to a lesser extent the same is true for Market Street.
- For the Haudagain roundabout, cars contribute more significantly to the total, particularly with regards PM₁₀ and PM_{2.5}.

3.3.2 Population Exposure

Technical guidance, LAQM.TG(09), requires local authorities to estimate the number of people who are predicted to be exposed to pollutant concentrations above the Air Quality Strategy objectives, in order to assist Defra and the Devolved Administrations to quantify the health benefits of improving air quality within the LAQM regime.

In the 2009 Further Assessment and 2010 City Centre modelling study reports (ACC, 2009b; ACC, 2010) estimations of population exposure were made based upon local knowledge, and given in accordance with the following terminology (number of properties exposed to concentrations in exceedence of air quality objective):

- Few <10
- Tens 10-100
- Hundreds 100-1000
- Thousands >1000

Wellington Road AQMA:

- Few (<10) properties are likely to be exposed to concentrations of NO₂ in excess of the annual mean Standard.
- By 2012, it was deemed unlikely that any properties would be exposed to concentrations of NO₂ in excess of the Standard.
- Hundreds (100-1000) of properties are likely to be exposed to PM₁₀ concentrations in excess of the annual mean Standard.
- By 2012 or 2016, it was deemed likely that the number of properties exposed to PM₁₀ concentrations in excess of the Standard would be in the *tens* (10-100) category
- It was added however: that given the discrepancies between the monitored and modelled values it was not appropriate to make a more accurate determination of the number of properties predicted to be exposed to concentrations above the Standard, nor the date by which there will be no properties exposed to concentrations above the Standard.

Anderson Drive AQMA:

- *Tens* (10-100) of properties are likely to be exposed to concentrations of NO₂ in excess of the annual mean Standard (restricted to the vicinity of Haudagain roundabout);
- By 2012 and 2016, it was deemed likely that the number of properties exposed to concentrations in excess of the Standard would be in the *few* (<10) category;
- Hundreds (100-1000) of properties are likely to be exposed to PM₁₀ concentrations in excess of the annual mean Standard.
- By 2012 and 2016, it was deemed likely that the number of properties exposed to concentrations in excess of the Standard will be in the *tens* (10-100) category, and mostly clustered around busier junctions.
- It was again added however: given the discrepancies between the monitored and modelled NO₂ it was not appropriate to make a more accurate determination of the number of properties predicted to be exposed to concentrations above the Standard, nor the date by which there will be no properties exposed to concentrations above the Standard.

City Centre AQMA:

- Hundreds (100-1000) of properties are likely to be exposed to concentrations of NO₂ in excess of the annual mean Standard;
- By 2012 and 2016, it was deemed likely that the number of properties exposed to concentrations in excess of the Standard would be in the *hundreds* and *tens* categories respectively;

- *Thousands* (>1000) of properties are likely to be exposed to PM₁₀ concentrations in excess of the annual mean Standard.
- By 2012 and 2016, it was deemed likely that the number of properties exposed to concentrations in excess of the Standard will be in the *thousands* and *hundreds* categories respectively.
- It was again added however: given the discrepancies between the monitored and modelled NO₂ it was not appropriate to make a more accurate determination of the number of properties predicted to be exposed to concentrations above the Standard, nor the date by which there will be no properties exposed to concentrations above the Standard.

3.4 Summary: The Scale and Extent of the Air Quality Problem in Aberdeen

NO₂ concentrations in excess of the mandatory EU annual mean limit value prevail near to some of the main roads and junctions in Aberdeen, affecting in the order of '*thousands*' of properties. The main areas of concern, where concentrations are well in excess of the annual mean limit value (as high as double) have been measured, are Haudagain roundabout, Union Street, and Market Street. Exceedences of the hourly averaged limit value have also been measured on Union Street and Market Street. Traffic is recognised as being the most significant contributor, accounting for up to 90% of the total NO₂ concentration.

 PM_{10} concentrations in excess of the Scottish annual mean objective are widespread. Whilst the problems areas are associated with traffic, concentrations in excess of the annual mean objective have also been measured at the urban background Errol Place monitoring location. It is likely however that the measured concentrations here are affected by the site's proximity to the coast. Whilst the PM_{10} exceedence areas cover a greater proportion of Aberdeen, and affect more people than for NO_2 , it should be acknowledged that the Scottish air quality objectives are not mandatory. Nevertheless it is the duty of ACC to reduce these concentrations as effectively as possible.

Whilst trends can be hard to identify due to meteorological influences, there is no evidence to suggest that roadside or background pollutant concentrations are decreasing in Aberdeen. Modelling studies predict that concentrations will fall in the coming years, however such reductions have not materialised in past years so such modelling outcomes must be treated with caution.

In the most polluted areas, traffic emission reductions of the order of 50-75% would be required for compliance with the mandatory NO₂ annual mean limit value.

| AQMA | Area | Typical Maximum annual mean Concentrations (μg/m ³) | | Required to | um Reduction meet mandatory Objective | Estimated properties currently exposed to concentrations in excess | | |
|--------------------|--|---|------------------|---|---|--|--|--|
| | | NO ₂ | PM ₁₀ | NO ₂ Road NO _X (μg/m ³) Emissions (% | | of Objectives | | |
| Wellington Road | | 40-45 | 24-26 | up to ~5 | ~10% | Few (<10) | | |
| Anderson Drive | Haudagain roundabout | 50-60 | 24-26 | up to ~20 | ~60% | Tens (10-100) | | |
| Drive | Elsewhere | 30-40 | 17-18 | - | - | - | | |
| | Union St / Holburn St / Guild St area | 50-70 | 24-26 | up to ~30 | ~75% | Hundreds (100-1000) | | |
| City Centre | Market St / Commerce St area | 50-70 | 26-29 | up to ~30 | ~70% | Tens (10-100) | | |
| | King St area | 50-65 | 26-28 | up to ~25 | ~75% | Hundreds (100-1000) | | |

Table 2: Existing Air Quality Summary

12

4 The Development of the Air Quality Action Plan

4.1 Introduction

This section of the AQAP describes the process followed in developing the Plan. Due regard has been made to the following key guidance:

- Local Air Quality Management Technical Guidance, LAQM.TG(09) (Defra, 2009a); and
- Local Air Quality Management Policy Guidance for Scotland, LAQM.PG(S)(09) (Defra, 2009b)

In essence the plan needs to:

- Show that a wide variety of options have been considered; *This is demonstrated in Section 5.*
- Quantify the source contributions, and hence allow appropriate measures to be identified; *This is covered in Section 3.*
- Show how ACC will implement the actions; The organisation/body responsible for implementing each action is indicated in Section 5
- Present clear timescales within which the actions can be implemented;
 Potential timescales are indicated in Section 5; these will be reviewed and refined during the course of the action plan and when reviewing progress
- Where possible quantify the impact of the actions on air quality;
 Where possible this has been undertaken, or the impact estimated. It is extremely difficult to quantify the impacts of many of the measures. Whilst some measures do lend themselves to modelling and impact quantification work, such work cannot be done until the appropriate traffic data is available.
- Show how ACC will monitor and evaluate the effectiveness of the plan. *This is discussed in draft form in the final section.*

During the development of the plan there have been various communications and meetings involving several ACC Services, and other stakeholders, such as Nestrans – the North East's Regional Transport Partnership. In particular, during October 2009 a meeting and workshop was held where potential measures to improve air quality were discussed. Members of NETCF (North East Transport Consultative Forum) were invited; approximately 35 members attended from a wide variety of bodies, organisations and businesses. A summary of the views expressed at the meeting is provided in Section 4.3.

In developing this plan, the following questions have been raised and considered:

- How feasible is the action / what barriers need to be overcome to allow it to be implementation?
- Over what timescale can the action be implemented?
- How 'acceptable' would the option be to the public?
- What would the likely costs associated with the action be, and to whom?
- How beneficial would the action be with regard to improving air quality?
- What would be the impact of the action with regards the wider environment and socio-economically?
- Who would be responsible for ensuring implementation and driving the action forward?

4.2 Previous Air Quality Action Plan (2006)

Appendix 2 summarises the actions and progress made within the 2006 AQAP.

Typically, whilst significant progress has been made against many of the actions, there is a great deal of uncertainty regarding what the effect of the actions has been on air quality. No progress has been made for some of the actions, largely due the actions turning out to be unfeasible, for a variety of reasons.

In drawing up this new Draft AQAP, due regard has been given to the successes or otherwise, over the past 4 to 5 years, of actions within the 2006 AQAP. It is also noteworthy that the 2006 AQAP covered the City Centre AQMA only. Many of the 2006 actions have been considered for inclusion within the new AQAP, although the emphasis of many has been altered.

4.3 NETCF Feedback Summary

Below is a summary of the feedback received from those present at the NETCF meeting of 8 October 2009, and from those who could not attend the meeting.

| Action Heading | Comments |
|--|---|
| Encourage Modal Shift | Need to: Change attitudes, habits and travel behaviour to discourage unnecessary car journeys; Focus on getting people out of cars to free up road space for necessary vehicles; Free up road space for alternative modes - cycling, walking and modern, clean, public transport; Encourage public transport priority schemes and attractive public transport: important factors include fares, frequency, comfort, reliability and routes; and Improve cycling and walking provisions (provide proper safe cycle lanes). |
| Road Infrastructure/ Traffic Management | Road infrastructure/traffic management measures required to facilitate progress on other actions; Respondents typically favoured by-pass and road infrastructure measures to decrease congestion, some respondents highlighted that road building only provides short term relief, and encourages more car trips; Similarly, the benefits of infrastructure measures e.g. AWPR/3rd Don crossing, must be 'locked in' to improve effectiveness of sustainable transport modes and encourage behaviour change; Alternative routes required to improve flow / reduce traffic volume and congestion on Market Street; Pedestrianisation generally viewed favourably, although concerns that it may move problems elsewhere, and that it could hinder alternative transport routes for cross City travel, particularly bus providers; Traffic management: small changes can have a cumulative large effect Parking: Respondents typically favoured increased parking restrictions and parking charges, discourage commuters, reduce private non-residential parking spaces provided by employers; Enforced vehicle delivery restrictions at peak hours; Consider further Park and Rides with fast, reliable buses; Idling vehicles easy to enforce, but need awareness campaign to promote the benefits; and Better synchronised traffic lights to avoid stop, start, stop etc |
| Planning and Strategic Policies | Improved master planning (structure plan); Essential support from Chief Executives across the public sector & NHS Grampian to enable significant air quality improvement; Improved links with other strategies e.g. NHS Grampian Public Health and Met office e.g. to enable messages to be sent to people suffering from chronic obstructive pulmonary disease (COPD); Progress links with Health and Transport Action Plan; New developments - 'lock in' funding for public transport improvements at early development stage e.g. subsidise over first 3 years; |
| Increase Cleaner Vehicle Usage | Encourage and promote cleaner vehicles and fuels e.g. electric vehicles (new electric bike with 60 mile range) Refuelling and recharging stations required Scrapping vehicles unlikely to extend to HGVs Freight Quality Partnerships need to be meaningful and involve all key stakeholders Public sector must take lead to encourage others Remove most polluting diesel buses and lorries ECO driving being implemented by commercial bus operators |

| Action Heading | Comments |
|------------------------|--|
| General | Range of measures needed, however need to communicate with public so don't fight against change Improve public awareness. Also need to direct awareness at individual drivers e.g. via real time air quality information on VMS Explore use of Park and Ride facilities for secure lorry parking at night Commercial delivery strategy worth considering Home zones an option - have limited air quality impact, but significant impact on road safety Develop initiatives to improve efficiency of freight movement Encourage rail freight increase by capitalising on rail gauge enhancements between Elgin and Mossend. Rail freight increase difficult due to location of freight yard and rail line infrastructure |
| Least Favourable | Road tolls and congestion charging generally viewed to be politically and economically unacceptable, although one comment considered peak period congestion charging a possibility. Only if essential traffic, including HGVs exempt from charge. Measures that penalise bad behaviour rather than promote good behaviour Light rail/tram - cost restrictive, limited route, disruption unpopular with public/business. Available resources should concentrate on improving attractiveness of bus fleet Banning cars in City Centre would kill City Centre |
| Low Emission Zones | Generally viewed as a good idea Should focus on car users as they have travel options Essential due to pollution levels Adopted already in many European cities Could have a massive benefit Would need public buy-in and be linked to air quality. Support by public awareness, education materials and events, appropriate signage, journey plan information Political PR? |
| Other general comments | Subsidised public transport - great in theory, but who pays? Who pays to improve bus fleet? Bus quality partnerships and Contracts - can be used to specify vehicle emission standards, however quality and convenience have greater impact on modal change and hence improved air quality Current financial climate is challenging for councils e.g. should lead by example to increase green fleet, but financially difficult |

4.4 **Action Appraisal**

To help determine which actions should be adopted by the AQAP, a scoring system was devised to allow the various actions to be rated and compared.

Feasibility:

- Score: 1 Readily feasible; no barriers
 - 2 Feasible; minor barriers easily overcome
 - 3 Potentially feasible
 - 4 Unlikely to be feasible; significant obstacles to be overcome
 - 5 Highly unlikely to be feasible

Public Acceptability:

Score: 1 - Highly acceptable

- 2 -
- 3 Neutral
- 4 -
- 5 Highly unacceptable

15

Relative Cost:

The estimated costs relate to the cost of provision where the measure is infrastructure works e.g AWPR, P & R etc... However, where the measure is the development of a plan or a policy, or national lobbying, the costs relate to the provision of the plan/policy (e.g. staff time), and not the actual implementation of the actions within.

For the scoring it is the relative cost that is important, the figures provided are purely indicative. It has not been the intention to carry out a detailed cost analysis.

| Score: | 1 - Very low | £ <10,000 |
|--------|---------------|--------------------|
| | 2 - | £ 10,000 - 100,000 |
| | 3 - | £ 100,000 - 1m |
| | 4 - | £ 1m - 10m |
| | 5 - Very High | £ >10m |

Air Quality Benefit:

It is important to note that when compared to the necessary reductions to meet the air quality objectives, even a score of 1 ('very substantial benefits') is unlikely to ensure that the air quality objectives would be achieved in many areas. The annual mean concentrations provided are indicative.

| Score: | 1 - Very substantial benefits, covering wide geographic area, including AQMAs | >2 g/m ³ |
|--------|---|--------------------------|
| | 2 - Significant benefits, covering wide geographic area, including AQMAs | 0.5 - 2 g/m ³ |
| | 3 - Small benefits, or significant benefits restricted spatially | 0 - 0.5 g/m ³ |
| | 4 - Negligible / imperceptible benefits | approx. 0 |
| | 5 - No benefits / potentially dis-benefits | ≤ 0 |

Where possible the air quality benefit has been quantified, otherwise the impact has been estimated. It is extremely difficult to quantify the impacts of many of the measures. Whilst some measures do lend themselves to modelling and impact quantification work, such work cannot be done until the appropriate traffic data is available.

Other Impacts:

- Score: 1 Overall large benefits likely
 - 2 Feasible; minor barriers easily overcome
 - 3 Neutral (either no other impacts or beneficial/detrimental impacts approximately balanced)
 - 4 Unlikely to be feasible; significant obstacles to be overcome
 - 5 Overall large detrimental impacts likely

Cost/Air Quality Benefit:

The cost/AQ benefit score has been calculated my multiplying the 'cost' score by the AQ benefit score. The best possible score would be 1; the worst 25.

Total Score:

The total score has been calculated my summing the feasibility, public acceptability, cost/AQ benefit, and other impacts scores. The best possible score would be 4; the worst 40.

5 Actions List Appraisal

5.1 Action Appraisal

All of the actions that have been appraised are detailed in Table 3. Details regarding timescales, responsibilities and funding are provided, along with the scores. Some of the scores (Air Quality Benefit, Cost/Benefit, and Total Score) are colour coded to help identify the actions that scored 'best'; lower (better) scores are shaded green, higher (worse) scores are highlighted red, 'medium' scores are highlighted in yellow.

The actions are categorised under the following six headings:

- 1. Modal Shift and Influencing Travel Choice
- 2. Lower Emissions and Cleaner Vehicles
- 3. Road Infrastructure
- 4. Traffic Management
- 5. Planning and Policies
- 6. Non-Transport Measures

Table 3: Appraisal of Actions

| | Measure | Detail | Timescale | Responsibility for driving forward | Funding | Feasibility | Public Acceptability | Relative Cost | AQ Benefit | Cost/AQ Benefit Score | Other Impacts (e.g. Carbon) | Total Score |
|------|------------------|--|-----------|--|-----------------------|-------------|-------------------------|---------------|------------|--------------------------|--------------------------------|-----------------|
| 1 | MODAL SHIFT & IN | FLUENCING TRAVEL CHO | ICE | | | | | | | | | |
| 1.1a | | Park & Ride | S-L | Nestrans/ Councils | Nestrans/ Councils | 2 | 2 | 4 | 3 | <mark>12</mark> | 2 | <mark>18</mark> |
| 1.1b | | Commercial Bus fleet improvement | S-L | Bus Operators | Bus Operators | 3 | 1 | 3 | 2 | 6 | 3 | <mark>13</mark> |
| 1.1c | Increase Bus Use | QBP (currently voluntary) | S-L | LABOF | LABOF | 2 | 1 | 2 | 3 | 6 | 2 | 11 |
| 1.1d | | BPIP (currently voluntary), Buchan/King St Corridor Improvements | S-L | LABOF | LABOF | 3 | 2 | 3 | 2 | 6 | 2 | <mark>13</mark> |

Comments

LABOF is the voluntary partnership of NESTRANS, Aberdeen City and Aberdeenshire Councils and the bus operators Stagecoach and First

Park and Ride schemes should encourage people to use public transport rather than private vehicles. By reducing the number of vehicles in the City Centre they should also help ease congestion. However the relative cost is fairly high, and the air quality benefits are likely to be fairly small (based on studies undertaken so far, such as for the proposed A96 P&R near Dyce). Air quality benefits could be enhanced significantly if the buses that serviced the P&R were required to meet certain emissions conditions. ACC/NESTRANS will investigate options to derive greater air quality benefits from P&Rs.

Through Nestrans' LA Bus Operators Forum (LABOF) there is the opportunity to improve and modernise the **commercial bus fleet** in Aberdeen, and hence make catching the bus a more attractive alternative the private car. Newer more modern buses will also pollute less. Opportunities for enforcing particular emissions standard will be examined during the Low Emission Zone feasibility Study (refer to Action 2.5); the potential air quality benefits will be calculated.

The **Quality Bus Partnership (QBP)** (ACC, AC, NESTRANS, Stagecoach, First Aberdeen) is voluntary; however it is an important partnership with a target of increasing bus use by improving the bus services across the region. It has great potential to encourage more people to use the bus rather than the car.

The **Bus Punctuality Improvement Partnership (BPIP)** has the specific aim of improving bus networks and services so that they are more punctual and reliable. It is likely to be relatively more costly than the QBP as it involves more implementation of measures rather than policy development. The Buchan/King Street Corridor (which routes into the City Centre AQMA) is the first corridor to be explored for targeted improvements within this BPIP agreement. Currently there are delays at the King St/E N E St junction onto Union Street and improvements are being investigated to give buses priority. The aim is to make BPIP work on a voluntary basis before considering statutory measures.

| | Measure | Detail | Timescale | Responsibility for driving forward | Funding | Feasibility | Public Acceptability | Relative Cost | AQ Benefit | Cost/AQ Benefit Score | Other Impacts (e.g. Carbon) | Total Score |
|------|-------------------|------------------|-----------|--|--|-------------|-------------------------|---------------|------------|--------------------------|--------------------------------|-----------------|
| 1.2a | Improve Cycling & | Core Paths Plan | S-L | ACC | ACC/ NESTRANS/ other partners | 2 | 1 | 3 | 4 | <mark>12</mark> | 2 | <mark>17</mark> |
| 1.2b | Walking Provision | Cycling Strategy | S-L | ACC | ACC/ NESTRANS/ other partners | 2 | 2 | 3 | 4 | <mark>12</mark> | 2 | <mark>18</mark> |

The Core Paths Plan has been adopted and is statutory; implementation is ongoing.

The Cycling Strategy is currently being reviewed; nevertheless the implementation of cycling measures is ongoing, as are promotion to encourage cycling.

Encouraging more people to cycle and walk will reduce car trips; an additional benefit is the health impact. However it is anticipated that air quality improvements in the City Centre as a consequence of the Core Paths Plan and Cycling Strategy will be minimal.

| | Existing Organisations | S-L | ACC & Nestrans | Businesses | 3 | 2 | 2 | 3 | 6 | 1 | <mark>12</mark> |
|------|------------------------|-----|-------------------|------------|---|---|---|----------------|---|---|-----------------|
| 1.3b | New Developments | S-L | ACC | Businesses | 1 | 1 | 2 | 3 | 6 | 2 | <mark>10</mark> |
| 1.3c | Council | S-L | ACC | ACC | 2 | 1 | 2 | <mark>3</mark> | 6 | 2 | <mark>11</mark> |

Comments

Travel Plans provide a framework to encourage employees to travel to work through sustainable means, and hence to minimise their impact on air quality.

ACC is responsible for ensuring that **new developments** submit a Travel Plan as part of the planning process. With regards to **existing commercial organisations** and businesses ACC will further promote the 'Travel Plan Builder Scheme' (<u>www.northeastscotlandtravelplans.co.uk</u>) and associated Sustainable Travel Grants. Potentially the air quality benefits from targeting existing organisations are greater than for new developments, however greater emphasis is required to persuade existing businesses to adopt greener practices.

ACC are currently updating their own Council Travel Plan; whilst ACC employs a large number of people in the City area, it is envisaged that the greatest air quality benefits will be indirect due to the fact that ACC will be seen to be leading by example. It is therefore important that ACC make public and advertise their progress with implementing their Council Travel Plan, emphasising the environmental benefits.

| | Measure | Detail | Timescale | Responsibility for driving forward | Funding | Feasibility | Public Acceptability | Relative Cost | fit | Cost/AQ Benefit Score | Other Impacts (e.g. Carbon) | Total Score |
|------|------------------|---|-----------|--|----------|-------------|-------------------------|---------------|-----|--------------------------|--------------------------------|-------------|
| 1.4a | | Use of Variable Messaging System (VMS) | S-L | ACC & Transport Scotland | ACC | 2 | 1 | 2 | 3 | 6 | 3 | 12 |
| 1.4b | Improve public | ACC Website Improvements | S | ACC | ACC | 1 | 1 | 2 | 4 | 8 | 3 | 13 |
| 1.4c | awareness of air | 'Airtext' Alert Service | S-M | ACC | ACC | 3 | 1 | 2 | 4 | 8 | 2 | 14 |
| 1.4d | quality issues | Get About Partnership | S-L | Get About | NESTRANS | 1 | 1 | 3 | 3 | 9 | 2 | 13 |
| 1.4e | | Information Events | S-L | ACC | ACC | 1 | 1 | 2 | 3 | 6 | 3 | 11 |
| 1.4f | | Marketing Initiatives (Walk to School) | S-L | ACC | ACC | 1 | 2 | 2 | 3 | 6 | _2 | 11 |

It is very hard to measure the impact on air quality of raising the public awareness of air quality issues. However it is very likely that the more people are aware of the connection between their travel choices and the quality of the air they breathe, the more likely they are to change behaviour, and most importantly, their own and their friends and colleagues' habits.

VMS is currently used in Aberdeen to provide drivers with general car parking guidance, enabling them to avoid driving unnecessarily looking for car parking spaces. Further VMS signs have recently been implemented around the City on key corridor approaches advising of incidents/events that may affect their travel onwards. ACC is also to use the VMS to post general air quality messages, particularly on peripheral City routes. These messages should raise awareness of air quality, especially during air pollution episodes. Further VMS signs are to be provided on the outskirts of the City, with the potential for further traffic management information options e.g. guidance to Park and Ride facilities.

Improving the **ACC website** will provide a means for ACC to raise awareness of air quality issues, to highlight initiatives that people can take part in to improve air quality, and potentially to be used as a resource for schools. Whilst the air quality benefits are likely to be imperceptible, the costs will be relatively low.

The 'Airtext' Alert service is used in a growing number of towns and cities, primarily to alert the vulnerable to episodes of poor air quality, and hence allow them to avoid more polluted areas. Air quality may benefit indirectly through greater awareness of the health implications of poor air quality.

The **Get About Partnership** (<u>www.get-about.com</u>) is a group dedicated to improving public awareness of transport issues. Their aim is to promote healthy and sustainable transport choices. The group includes Nestrans, ACC, Aberdeenshire Council, Robert Gordon University, the University of Aberdeen, Aberdeen College, NHS Grampian, The Energy Savings Trust, and Dyce Transportation Management Organisation. As a member of the group ACC will promote awareness of air quality through the partnership.

ACC will hold more **information events**, at locations such as schools. A laptop and screen has been purchased for public displays and promotion activities. ACC will develop an information package to be distributed at events. Initiatives such as 'Bike to work', 'safer routes to school', and 'walk to school' will be promoted and encouraged.

ACC is to continue procuring 'green' vehicles (all diesel vehicles Euro V, particulate traps fitted to Euro III and older vehicles). This is being implemented as part of ACC's Carbon Management Programme. An Energy Saving Trust grant application is proposed to help fund.

The **Quality Bus Partnership (QBP)** (ACC, NESTRANS, AC, Stagecoach, First Aberdeen) is voluntary rather than statutory. Nevertheless, it is an important partnership with a target of increasing bus usage by improving the bus services in the City. As partners, ACC will push to ensure that as 'green' vehicles as possible are procured by the bus companies. This will be examined in greater detail through the LEZ feasibility study.

Through the NESTRANS Freight Action Plan (FAP) a Freight Quality Forum has recently been set up. Through this forum and the framework set out in the FAP, ACC with partners will examine ways of encouraging and assisting the procurement of greener vehicles by the freight industry. In particular Action 13 within the FAP can be used to encourage procurement of greener vehicles. The main problem is the associated costs.

ACC will examine opportunities to encourage and incentivise smaller local businesses to use greener vehicles and fuels.

| 2.2c | | FQ Forum, BQP | S-L | ACC & Nestrans | Bus Companies/ Businesses | 2 | 1 | 2 | 3 | 6 | 3 | 12 | |

Comments

There is the potential for all road users to use less fuel, and therefore save money and reduce air quality impacts, purely through altering their driving behaviour and looking after their vehicle.

The Energy Saving Trust (EST), for no cost, have made their eco driving simulator available to Council staff, over several days in 2009. ACC will seek to ensure this is a regular event, which is publicised locally, to raise awareness of how all drivers, can reduce the impact of their driving on the environment.

ACC will consider ways to encourage other organisations and businesses and the public to drive more efficiently, through a marketing campaign.

ACC will use its role in both the FQ forum and BQP to encourage businesses and bus companies to train their drivers to drive more efficiently, to save fuel and reduce tyre wear. First Aberdeen already have a system in place whereby its bus drivers are monitored, and the drivers who drive most efficiently are rewarded. In the short time First Aberdeen have been running this scheme they have seen significant reductions in fuel consumption, and are recognising the economic benefit.

| | Measure | Detail | Timescale | Responsibility for driving forward | Funding | Feasibility | Public Acceptability | Relative Cost | AQ Benefit | Cost/AQ Benefit Score | Other Impacts (e.g. Carbon) | Total Score |
|------|-------------------------------|-------------------------------|-----------|--|---------|-------------|-------------------------|---------------|------------|--------------------------|--------------------------------|-------------|
| 2.5a | Emissions Testing & Idling | Roadside Emissions Testing | S-L | ACC | ACC | 2 | 2 | 2 | 4 | 8 | 3 | 15 |
| 2.3b | Enforcement | Idling Vehicles | S-L | ACC | ACC | 1 | 2 | 1 | 4 | 4 | 3 | 11 |

The direct impact to air quality of roadside emissions testing is likely to be negligible. So far only a small number of vehicles have failed the test. Therefore to ensure maximum benefit ACC will ensure that the tests are publicised as widely and effectively as possible to raise awareness of the importance of car maintenance in reducing the environmental and health impact of driving.

ACC has adopted the powers under the Road Traffic (Vehicle Emissions)(Fixed Penalty)(Scotland) Regulations 2003 that permit local authorities to request drivers to switch off vehicle engines being run unnecessarily when parked and to issue fixed penalty of £20 to those drivers who fail to co-operate. To date no fixed penalty notices have been served and the direct impact of enforcement of the powers is likely to be negligible. However, greater enforcement, for example via City Wardens and greater publicity will contribute further to raising awareness of air quality issues.

| 2.4b | Taxis | Licensing: vehicle inspections, emissions restrictions | S-M | ACC | | 3 | 1 | 3 | 3 | 9 | 2 | 15 |

Comments

ACC will encourage taxi drivers to turn off their engines at taxi ranks; signs will be put up, and leaflets delivered to the taxi companies explaining the rationale. Whilst the impacts to air quality may be imperceptible, and highly localised, the measures will contribute further to raising awareness of air quality issues.

ACC will investigate options to improve the emissions profile of the licensed taxi fleet, potentially through further vehicle inspections, vehicle age restrictions, and emissions restrictions (this will be examined in greater detail in the LEZ feasibility study).

|---|---|-------------------|-------------------|---|---|---|---|---|---|----|

Comments

EU funding has been secured to undertake an LEZ feasibility study. This will be undertaken during 2010.

In general terms a LEZ is a geographic area within which particular vehicle emissions restrictions are imposed. Whilst there are few LEZs in the UK there are many in Europe, ranging greatly in size and area, vehicles targeted, and method of enforcement.

The feasibility study will consider various options, in terms of potential air quality benefits, spatial extent, costs, implementation etc...

The costs would be heavily dependent on the nature of the LEZ.

| 3.1 | Pedestrianisation | of the central section of Union Street (Bridge Street to Market Street) | М | ACC | ACC | 2 | 2 | 4 | 3 | 12 | 2 | <mark>18</mark> |

The pedestrianisation of the central section of Union Street from Bridge Street to Market Street is proposed to be completed in line with the timescales for the opening of the AWPR. Modelling work has shown that (other than the obvious benefits for the pedestrianised section) there will be wider benefits due to the fact Union Street will not be such an attractive 'through route' for drivers. Nevertheless there will also be detrimental air quality impacts for routes circuiting the pedestrianised area. Other benefits include pedestrian safety and improved access to retail premises. ACC has no plans to pedestrianise other roads.

Comments

Construction of the Aberdeen Western Peripheral Route (AWPR) is currently subject to the on-going legal challenge which is to be considered by the Court of Session. The Environmental Statement, and further modelling undertaken for the 2008 Detailed Assessment predicted significant air quality improvements in the centre of Aberdeen and on Anderson Drive, due to a reduction in traffic. The AWPR will provide a route around Aberdeen for traffic travelling from north to south. The benefits in Aberdeen out-weighed the detrimental impacts near to the proposed route.

ACC are currently undertaking an air quality assessment for the proposed Third Don Crossing (a third crossing of the River Don, 2-3 km north of the city centre). Based on an earlier air quality assessment undertaken in 2005 the scheme is predicted to have an overall detrimental impact, although the areas expected to be detrimentally impact are not areas of concern. Beneficial impacts are likely in existing areas of poor air quality, such as King Street and the Haudagain roundabout.

ACC have undertaken an air quality assessment for the proposed Berryden Corridor improvements, to the north of the city centre. The scheme is likely to improve the flow of traffic to and from the City from the north, but may bring traffic closer to certain properties. However, overall the air quality impacts was predicted to be neutral. The cost will be high, but it is favoured by the majority of the public.

ACC have identified a preferred option for improvements at the Haudagain roundabout, currently an area of poor air quality within an AQMA. An air quality assessment has been undertaken. The improvements could lead to a reduction in exposure to pollutants, depending upon the finalised plans, due to the proposed road realignment and faster flowing traffic, although only a small area affected. The cost will be high, but it is favoured by the majority of the public. As this is a trunk road junction, the final agreement on the form, timescale and delivery of improvements at this location lies with the Scottish Government/Transport Scotland. The Scottish Government has made clear its commitment to starting improvements at the Haudagain Roundabout immediately after completion of the AWPR.

| 4.3d | | Weigh Bridge relocation | S-M | VOSA | | 3 | 2 | 3 | 3 | 9 | 3 | 17 |

Freight is responsible for a significant proportion of road traffic emissions in Aberdeen; particularly on roads such as Market Street and Wellington Street (refer to Section 3.3).

ACC are considering various HGV priority measures, such as on Wellington Road. These may include junction alterations. Through reducing congestion in this manner the impact of HGVs on air quality is likely to reduce.

It is identified in the NESTRANS Freight Action Plan (FAP) that current HGV delivery restrictions may actually be contributing to congestion. Action 24 of the FAP highlights the need for the restrictions to be reviewed. ACC with partners will review the Commercial Delivery Strategy, with due regard for opportunities to reduce emissions, and consideration of enforcement.

Currently there is a statutory requirement for HGVs once loaded to visit the nearest weighbridge. Aberdeen Harbour Board has confirmed that 90% of the users of the weighbridges within the Harbour relate to vessels in the harbour so the weigh bridges create few additional journeys. However, the consideration of the re-instatement of the former weighbridge at Portlethan may still result in fewer HGVs requiring to travel along Market Street.

An intermodal freight consolidation centre scoping study is currently underway to determine the demand for such a facility, options and cost implications. Whilst the costs of a new facility will be high, there will be the potential for air quality improvements should fewer vehicles need to travel through the city centre.

| 4.4 | Speed Regulation | 20 mph areas | S-L | ACC | ACC | 3 | 2 | 2 | 5 10 |) 2 | 17 | |
|------|------------------|--------------|-----|-----|-----|---|---|---|------|-----|----|--|
| Comr | nents | | | | | | | | | | | |

20 mph speed regulation may discourage driving, but would be primarily implemented for safety. Air quality benefits would not be anticipated due to a potential increase in vehicle emissions.

| | Measure | Detail | Timescale | Responsibility for driving forward | Funding | Feasibility | Public Acceptability | Relative Cost | | Cost/AQ Benefit Score | Other Impacts (e.g. Carbon) | Total Score |

| 5 | PLANNING & POLI | CIES | | | | | | | | | | |
| 5.1a | Produco | Improve Development Control | S | ACC | ACC | 1 | | 2 | 3 | 6 | 2 | 10 |
| | Produce Supplementary Planning Guidance | Section 75 monetary contributions | S | ACC | ACC | 2 | 2 | 2 | 4 | 8 | 3 | 15 |
| 5.1c | | Construction Code of Practice | S | ACC | ACC | 2 | | 2 | 4 | 8 | 3 | 14 |

Through development control ACC can prevent developments going ahead, or implement planning conditions, to protect air quality. By producing supplementary planning guidance (SPG) for air quality, ACC will be able to further reduce the impact of new development, both during construction and once operational. ACC will seek for new developments to have beneficial impacts where possible. The SPG will provide a framework whereby Section 75 monetary contributions can be sought from developers where adverse impacts are predicted. Such contribution could be used to fund measures (within this AQAP) to improve air quality. The SPG will also include a Construction Code of Practice, which developers will be required to follow to minimise impacts from construction sites and construction vehicles.

| 5.2 | Integration of AQAP with Local Transport Strategy (LTS) and Regional Transport Strategy (RTS) | М | ACC and Nestrans | ACC | 2 | 1 | 1 | 4 | 4 | 3 | 10 |
|-----|--|---|---------------------|-----|---|---|---|---|---|---|----|
|-----|--|---|---------------------|-----|---|---|---|---|---|---|----|

Comments

The LTS is due for renewal in 2012. It is very important that both the LTS and RTS have a strong air quality focus, thereby raising the profile of air quality issues and ensuring that air quality concerns are given high priority.

| 5.3 | Integration of AQAP with Health and Transport Action Plan (HTAP) | Highlight Health Impacts | S | ACC / NHS/ other partners | ACC | 2 | 1 | 1 | 4 | 4 | 3 | 10 |
|-----|---|--------------------------|---|------------------------------------|-----|---|---|---|---|---|---|----|
|-----|---|--------------------------|---|------------------------------------|-----|---|---|---|---|---|---|----|

Comments

The Health and Transport Action Plan (HTAP) is being developed by NHS Grampian for the Grampian region with Grampian Police, Grampian Fire and Rescue, NESTRANS, ACC and Aberdeenshire Council. ACC will ensure that the actions within the AQAP and the HTAP complement one another, and where appropriate are implemented in a coordinated manner.

| 5.4 | , | Reclassification of Union St / Denburn (requires TRO) | S | ACC | | 2 | 2 | 1 | 4 | 4 | 3 | 11 |
|-----|---|---|---|-----|--|---|---|---|---|---|---|----|
|-----|---|---|---|-----|--|---|---|---|---|---|---|----|

Comments

Union Street is an A-road, and consequently is identified by satellite navigation systems as a priority route. By reclassifying Union Street (and Denburn Rd), this should reduce unnecessary traffic from using Union Street, and reduce congestion. ACC will investigate reclassification through a TRO.

| | Measure | Detail | Timescale | Responsibility for driving forward | Funding | Feasibility | Public Acceptability | Relative Cost | AQ Benefit | Cost/AQ Benefit Score | Other Impacts (e.g. Carbon) | Total Score |
|------|-------------|--|-----------|--|-------------------|-------------|-------------------------|---------------|------------|--------------------------|--------------------------------|-------------|
| 5.5a | | Low Emission Vehicle Parking Incentives | S-M | ACC | | 3 | 2 | 2 | 3 | 6 | 2 | 13 |
| 5.5b | Car Parking | Limit car parking for new developments | S-L | ACC | | 3 | 2 | 1 | 4 | 4 | 2 | 11 |
| 5.5c | Policies | Development of Local and Regional Car Parking Policies | S-M | ACC & Nestrans | ACC & Nestrans | 2 | 3 | 4 | 2 | 8 | 2 | 15 |
| 5.5d | | Workplace Parking Levy | M-L | ACC | | 5 | 4 | 2 | 3 | 6 | 2 | 17 |

ACC will consider the feasibility of encouraging drivers to use low emission vehicles through City Centre parking incentives. This will also be examined further through the LEZ feasibility study.

ACC will consider the feasibility of further limits on car parking for new developments. Potential obstacles could include business acceptability issues.

Through the development of local and regional car parking policies, the potential exists for significant air quality benefits to be realised. ACC will work with Nestrans to ensure that the Policies are formulated with due regard for air quality considerations.

Currently, under Scottish law, a workplace parking levy would not be lawful and therefore is unfeasible.

| 5.6a | | Incentives/funding/tax breaks for Low Emission Initiatives | S-L | ACC | ACC | 2 | 2 | 1 | 3 | 3 | 3 | 10 |
|------|-------------------|--|-----|-----|-----|---|---|---|---|---|---|----|

| 5.6c | | HGV/Bus Scrappage schemes | S-L | ACC | ACC | 4 | 2 | 1 | 2 | 2 | 2 | 10 |

Comments

ACC will lobby nationally whenever appropriate to influence policies that may affect air quality in Aberdeen. The relative cost here refers to the cost to ACC of staff time. Incentives/funding/tax breaks for Low Emission Initiatives could have a significant air quality impact. ACC would also like to lobby nationally for more stringent shipping emissions regulations and fuel standards.

A hypothetical HGV/Bus scrappage scheme would be envisaged to have potential significant air quality benefits, although it is unlikely to be feasible.

5.2 Appraisal Discussion

5.2.1 Modal Shift and Influencing Travel Choice

Typically most measures scored well, although those that would deliver the greatest air quality benefit would also be the most unfeasible and unacceptable (1.9 Congestion charging / Road tolls). The measures with the best total score would not necessarily deliver significant air quality benefits (e.g. 1.4f Marketing initiatives), but scored well due to being readily feasible, acceptable and of low cost. Measures likely to give more significant benefits scored comparatively worse due to greater costs (e.g. 1.1b Bus fleet improvement).

The Park and Ride option did not score as well as may have been expected. Air quality benefits could be enhanced significantly if the buses that serviced the P&R were required to meet certain emissions conditions. ACC will investigate options to derive greater air quality benefits from P&Rs.

In summary numerous measures have been identified to encourage modal shift. Whilst no one measure was predicted to result in significant air quality benefits, the combined impact of the many measures should result in a significant impact. The majority of the measures scored well in terms of feasibility and acceptability, with relatively fast implementation.

Public Transport Subsidies and Congestion Charging (1.8 and 1.9) will not be included within the AQAP.

5.2.2 Lower Emissions and Cleaner Vehicles

Measure 2.5 (LEZ) scored very well, and promises the greatest air quality benefits, of any action in the Plan. It is currently the subject of a feasibility study.

The other measures that scored best overall, again were predicted to offer very small to negligible air quality benefits and scored well by virtue of their low cost, feasibility and acceptability (e.g. Eco-driving (2.2)).

Green vehicle procurement (2.1) was generally identified to offer the greatest beneficial air quality impacts, and will be considered in conjunction with the LEZ study.

All of the measures will be included in the AQAP.

5.2.3 Road Infrastructure

The proposed pedestrianisation of a section of Union Street is currently programmed to be implemented in line with the timescales for the AWPR. Overall, benefits will be likely, although there will also be localised detrimental impacts outwith the City Centre AQMA,

Of the road building measures, only the AWPR was predicted to result in a beneficial air quality impact. However the improvements at Haudagain also have the potential to result in a localised beneficial impact. ACC will ensure that the final proposals delivered by Transport Scotland/Scottish Government offer the maximum air quality benefit. An air quality assessment is currently being undertaken for the Third Don Crossing; however it is not anticipated that the scheme will deliver overall air quality benefits. Similarly the Berryden corridor improvements are not likely to benefit air quality overall.

Traffic calming (3.3) is primarily implemented for safety; air quality benefits would not be anticipated and therefore it will not be in the AQAP.

5.2.4 Traffic Management

No one measure was predicted to offer significant air quality benefits, however, the combined impact of the measures should result in a significant impact.

Of the measures, ITS (4.1) resulted in the best overall score, primarily due to scoring favourably for feasibility, acceptability and cost. It also has the potential to significantly improve air quality locally by reducing congestion.

Measures to address freight (4.3) typically did not result in particularly favourable scores, mainly due to issues regarding feasibility and cost.

Speed regulation (4.4) will not be included within the AQAP; air quality benefits would not be anticipated.

5.2.5 Planning and Policies

Within planning and policies, the direct impact to air quality was determined to be fairly minimal for most actions. However for many of the actions the associated costs are low, and the actions can be implemented quickly.

National lobbying scored well, in part due to the minimal costs involved in lobbying. However the likelihood of the lobbying being successful (e.g. for HGV/bus scrappage schemes) was typically low.

Car parking policies were determined to have the potential to have a significant air quality impact, ACC will explore ways in which air quality issues can be given high priority.

The following actions will not be in the AQAP: Workplace Parking Levy (5.5d), Movement of Receptors (5.7) or Relocation of Employers (5.8).

5.2.6 Non-Transport Measures

The non-transport measures that were considered will all be a part of the AQAP. Typically none of the measures are considered, on their own, to have a significant air quality impact, although the control of biomass installations and industry permitting are clearly essential to prevent any further deterioration in air quality.

With regards to options to minimise the impact of the shipping and the harbour, ACC will investigate various initiatives in liaison with the Harbour.

5.2.7 Interaction with Climate Change Strategies

Aberdeen City Council does not have a Climate Change Strategy; however a Carbon Management Plan was adopted in April 2010. The Plan covers the period 2010-2015 and aims to reduce CO_2 emissions from Council buildings, vehicles, street lighting and landfill by 23% by 2015 and 42% by 2020. In 2007 Aberdeen, alongside other Scottish local authorities, signed the Climate Change Declaration demonstrating ongoing commitment to combating the effects of climate change. Aberdeen's Climate Declaration Report 2009 considers actions to reduce emissions from specific council operations and the wider authority area.

No specific reference is made to air quality in either report; however the majority of proposed actions will have a positive impact on air quality. For example, the Carbon Management Plan considers the council's fleet, including the introduction of alternate weekly collections to reduce the number of journeys, business travel plans and a review of the Council's car usage, car parking and travel plans. Emissions from premises are also considered with the replacement of inefficient oil fired burners in schools and the main council office and a general reduction in energy usage. There are a few proposals within the Plan that will have a potential negative air quality impact. For example, an increase in the fleet vehicles using biodiesel from 2 to 20 and the provision of a biomass boiler within the new council main council building. However, as the existing council building uses oil, the overall impact may be positive.

Officers in the council responsible for climate change are part of the air quality action plan working group to ensure that future climate change and air quality policies are complementary. The vast majority of the measures within this AQAP will have a beneficial or neutral impact on greenhouse gas emissions. However Measure 6.1, Control Biomass Installations, has the potential to conflict with the Council's Carbon Management Plan. Therefore the council will strive to ensure that Measure 6.1 does not have the effect of reducing the uptake of biomass, but will ensure that only the cleanest biomass boilers are installed.

5.3 Measures to be Implemented

The measures in Table 4: over the following pages, categorised under the following six headings, form the AQAP.

- 1. Modal Shift and Influencing Travel Choice
- 2. Lower Emissions and Cleaner Vehicles
- 3. Road Infrastructure
- 4. Traffic Management
- 5. Planning and Policies
- 6. Non-Transport Measures

Table 4: AQAP Measures

| | Measure | Detail | Timesca le | Responsibility (for driving forward) |
|------|--|--|---------------|---|
| 1 | MODAL SHIFT & INFLUENCING 1 | RAVEL CHOICE | | |
| 1.1a | | Park & Ride | S-L | ACC/Nestrans |
| 1.1b | | Commercial Bus fleet improvement | S-L | Bus Operators |
| 1.1c | Increase Bus Use | QBP (currently voluntary) | S-L | LABOF |

| 2.3b | Enforcement | Idling Vehicles | S-L | ACC |
| 2.4a | | Non-idling signs | S-M | ACC |
| 2.4b | Taxis | Licensing: vehicle inspections, emissions restrictions | S-M | ACC |
| 2.5 | Low Emission Zone | Low Emission Zone | М | ACC & Nestrans |
| 3 | ROAD INFRASTRUCTURE | • | | |
| 3.1 | Pedestrianisation | of Union Street | М | ACC |
| 3.2a | Road Building / Junction | Aberdeen Western Peripheral Route | M | AWPR Managing Agent |
| 3.2d | Alterations | Haudagain Improvements | М | Transport Scotland |
| 4 | TRAFFIC MANAGEMENT | | | |
| 4.1 | Intelligent Transport System (ITS) | To reduce city centre congestion | М | ACC |
| | High Occupancy Vehicle (HOV) | Stonehaven Road | M-L | ACC |
| 4.2 | Lane | | | |

| | Measure | Detail | Timesca le | Responsibility (for driving forward) |
|------|--|--|---------------|---|
| 4.3b | Access | Commercial Delivery Strategy (routing, timing, idling control) | М | ACC |
| 4.3c | | Freight Consolidation Centre | М | ACC |
| 4.3d | | Weigh Bridge | S-M | VOSA |
| 5 | PLANNING & POLICIES | | | |
| 5.1a | Produce Supplementary Planning | Improve Development Control | S | ACC |
| 5.1b | Guidance | Section 75 monetary contributions | S | ACC |
| 5.1c | | Construction Code of Practice | S | ACC |
| 5.2 | Integration of AQAP with Local Transport Strategy (LTS) and Regional Transport Strategy (RTS) | | М | ACC and Nestrans |
| 5.3 | Integration of AQAP with Health and Transport Action Plan (HTAP) | Highlight Health Impacts | S | ACC / NHS /NESTRANS |
| 5.4 | Road Hierarchy | Reclassification of Union St / Denburn (requires TRO) | S | ACC |
| 5.5a | | Low Emission Vehicle Parking Incentives | S-M | ACC |
| 5.5b | Car Parking Policies | Limit car parking for new developments | S-L | ACC |
| 5.5c | | Development of Local and Regional Car Parking Policies | S-M | ACC & Nestrans |
| 5.6a | National Labbring | Incentives/funding/tax breaks for Low Emission Initiatives | S-L | ACC |
| 5.6b | National Lobbying | Shipping Emissions Reductions | S-L | ACC |
| 5.6c | | HGV/Bus Scrappage schemes | S-L | ACC |
| 6 | NON-TRANSPORT MEASURES | | | |
| 6.1 | Control Biomass Installations | Enforce new developments to only install 'cleanest' biomass boilers | S-L | ACC |
| 6.2 | Industry Permitting | | S-L | ACC and SEPA |
| 6.3 | Tree Planting | Pro-active planting of tree species with a positive air quality impact and avoid planting varieties that may have detrimental air quality impact | S-L | ACC |
| 6.4 | Shipping | Consider actions available at Aberdeen Harbour | S-L | ACC & Aberdeen Harbour |

5.4 Implementation of the Action Plan

Once adopted, the Council will ensure that the plan is implemented, and will monitor each measure to determine the progress achieved and any associated improvements in air quality. This shall be achieved through regular meetings of the Council's Air Quality Working Group. Progress will also be reported to the Scottish Government through the Local Air Quality Management review and assessment regime. The Plan will additionally be reviewed and updated to account for changes in Council policies, funding and pollution levels.

Appendix 3 contains the table that will be used to report on progress annually. It contains timescales for each measure, shows the body responsible for driving each measure forward, and details the indicators that will be used to track progress. Essentially the indicators can be broadly categorised as follows:

- Actions that can only be assessed qualitatively through the duration of the Action Plan. e.g. Measure 1.4b ACC Website Improvements

- Actions that can be assessed qualitatively through the duration of the Action Plan, but will include proxy indicators. e.g. Measure 1.1 Increase Bus use – identified through bus patronage data.
- Actions that can be assessed quantitatively throughout the duration of the Action Plan.
 e.g. Measure 3.1 Pedestrianisation (of Union St) monitoring data can be used to demonstrate impacts
- Actions that can be assessed quantitatively once the required data is available.
 e.g. Measure 4.2 High Occupancy Vehicle (HOV) Lane air quality modelling can be undertaken once traffic data available

Many of the indicators will be already identified through other Council plans, such as the Local Transport Strategy (LTS). The exact detail of the indicator will be partly dependent on these other strategies and plans, and will be decided during reporting.

5.5 Consultation

The Draft Quality Action Plan was released for consultation on 7 October 2010. A wide variety of businesses, organisations and other stakeholders, including the public, have responded and commented. The consultation period ran from 7 October 2010 to 26 November 2010. ACC sought to get as much feedback as possible and as such created an online survey (a link to the survey was provided at www.aberdeencity.gov.uk) and publicised the action plan though the publication of a short leaflet (available at www.aberdeencity.gov.uk) and publicised the action plan though the publication of a short leaflet (available at www.aberdeencity.gov.uk) ibraries, community centres and other council premises). The leaflet is reproduced in Appendix 5. A summary of the questionnaire responses is provided in Appendix 4.

The online survey was predominantly filled out by individuals (94%), rather than people representing businesses and organisations. Over 200 responses were recorded. A wide variety of respondents were recorded, including:

- Aberdeen City Council
- NHS Grampian
- Garthdee Community Council
- Aberdeen Harbour
- Henry E Rae Community Centre
- Fire Service
- University of Aberdeen
- Cairngorm National Park Authority
- Cyclists Touring Club
- Stagecoach Bluebird
- Freeland Freight Service Ltd

The following bullet points summarise the key outcomes of the consultation:

- Most respondents pass through and are concerned by air quality in the city centre AQMA, followed by the Anderson Drive AQMA. Relatively few pass through or are concerned about the Wellington Road AQMA.
- Almost half the respondents travel through the AQMA(s) by car, van, or lorry, the remainder by walking, cycling and public transport.
- Typically respondents supported the actions within the Plan; particularly strong support was expressed for:
- Better public transport and Improved bus services (although several respondents expressed support for trams, which were not considered in the Action Plan)
- Improved walking/cycling provision
- Low Emission Zone
- Pedestrianisation
- Tree Planting
- Road Infrastructure Improvements, particularly a by-pass
- Traffic Management Improvements (improved traffic light signalling, vehicle prioritisation etc..)
- Measures to get people out of their cars

- For all the measures listed in the survey more expressed support than expressed opposition, however, measures that received most opposition were:
 - High occupancy vehicle / car share lanes
 - Freight / Business Priority Measures
- No single measure will bring about the required improvement so a whole range of measures are needed

Several key stakeholders, including Aberdeen Harbour Board, SEPA and AEA Technology (on behalf of the Scottish Government), provided further detailed comments that will be considered during the implementation of the Action Plan. These included:

- Support for an investigation of emissions from shipping activities at Aberdeen Harbour
- Measures that improve HGV access to the port area and promote modal shift from road to rail, including the consideration of a freight consolidation centre.
- Concerns that, without careful consideration and planning alterations to commercial delivery strategies and/or a LEZ could impact on the ability of businesses to operate effectively and competitively
- The Plan should include site site specific studies to show which measures should be applied in the 3 AQMAs and the level of improvement likely
- Measures to ensure that any additional buses required for Park and Ride facilities are fitted with low emission engines.
- The need to provide a better link to the Strategic Development Plan (SDP) for Aberdeen City and Shire to address cross boundary issues such as road freight and commuter traffic. However, the intention to provide Supplementary Planning Guidance is welcomed as it shows how the planning system can help deal with air quality issues.
- Based on the source apportionment studies heavy duty vehicles are the main source of pollution and therefore buses and HGVs should be tackled; support was expressed for a LEZ.
- The importance of successful monitoring of the actions to ensure that the predicted reductions actually happen

5.5.1 Consultation Summary

A wide variety of responses and opinions were received, which predominantly were in support of the measures within the Action Plan. ACC and its partners will progress with the implementation of actions within the plan, taking account of the responses received and the concerns of the public, businesses and organisations. As action planning is a continual process in which annual progress is assessed, we will take the consultation responses on board for the continual development of the plan.

6 Summary

The following three Air Quality Management Areas (AQMAs) have been designated in Aberdeen due to existing and predicted exceedences of national air quality objectives and European limit values for nitrogen dioxide (NO₂) and fine particles (PM₁₀):

- City Centre (including Union Street, Market Street, Commerce Street, Virginia Street and parts of Holburn Street, King Street and Guild Street)
- Anderson Drive (incorporating the whole of Anderson Drive and the area around the Haudagain roundabout)
- Wellington Road (Queen Elizabeth II Bridge to Balnagask Road)

Road traffic is the main source of the raised NO_2 concentrations and significantly contributes to the PM_{10} concentrations. It is necessary to improve air quality to protect the health of the City's inhabitants and comply with the objectives.

This Air Quality Action Plan describes the measures Aberdeen City Council will take to improve air quality in the three AQMAs and replaces the outdated 2006 City Centre Action Plan. Measures to be implemented have been categorised into the following six headings:

- 1. Modal Shift and Influencing Travel Choice
- 2. Lower Emissions and Cleaner Vehicles
- 3. Road Infrastructure
- 4. Traffic Management
- 5. Planning and Policies
- 6. Non-Transport Measures

It is clear that a range of innovative and far reaching measures must be implemented to achieve considerable reduction in pollution levels and compliance with the air quality objectives. Many of the proposed Actions are committed infrastructure measures such as the Aberdeen Western Peripheral Route and pedestrianisation of Union Street or build on existing plans and policies. Additional measures aim to support modal shift and reduce car dependency, encourage the use of cleaner vehicles, promote greater awareness of the air quality issues in Aberdeen and consider further traffic management measures. A feasibility study is also ongoing into the potential for a Low Emission Zone in Aberdeen which could significantly improve air quality.

The Draft Quality Action Plan was released for consultation in October 2010. A wide variety of responses and opinions were received, which predominantly were in support of the Action Plan. ACC and its partners will progress with the implementation of actions within the plan, taking account of the responses received and the concerns of the public, businesses and organisations. As action planning is a continual process in which annual progress is assessed, we will take the consultation responses on board for the continual development of the Plan. We continue to welcome any further comments on the Plan, or on air quality in general at any stage over the coming years, and wish to thank all those who have contributed during the consultation period.

The implementation of the Action Plan will be monitored and the Plan reviewed and updated to account for changes in Council policies, funding opportunities and pollution levels. This will be achieved via regular meetings with the Council's Air Quality Working Group. Progress also will be reported to the Scottish Government through the Local Air Quality Management Regime.

| | 2006 AQAP Summary | | | | | | | | | | |
|------|---|---|------------------------------|--------------|---|--|--|--|--|--|--|
| Ref | 2006 Proposed Action | Time Frame | Are impacts Quantifiable? | AQAP page | Progress | | | | | | |
| Long | Term Actions - s | ubject to extens | ive public const | Iltation | | | | | | | |
| 13 | Restrict traffic through AQMA using VMS | | YES | 24 | Originally stated that this "would only progress if other measures failed". Summary: Not progressed; action concluded to be unfeasible, | | | | | | |
| | | | | | costs would be too large. | | | | | | |
| 14 | Low Emission | | YES | 25 | Originally stated that this "would only progress if other measures failed". | | | | | | |
| | Zones | | | 20 | Summary: Funding was secured for LEZ feasibility study, which is now underway | | | | | | |
| 15 | AWPR | 2012/13 | YES | 26 | Route finalised March 2006, ES published September 2007; Public Local Inquiry held between September and December 2008. Scottish Minsters decision announced on 21 December 2009. It had been hoped to start construction in 2011 however legal challenges submitted to the Court of Session in May 2010 will delay construction of the AWPR. Assuming a successful outcome to the appeal a thorough review of the remaining stages of the project will need to be undertaken before issuing a definitive timetable to construction. Summary: Notable air quality benefits predicted for the city centre and Anderson Drive. | | | | | | |
| 16 | Cross-rail from/to city & outwith city | Phase implementation over 7 years | YES | 26 | NESTRANS developing rail action plan breaking down components of Cross-rail. Laurencekirk station open May 2009. Proposals for Kintore being developed. (subject to appropriate traffic modelling being undertaken) Summary: Beneficial air quality impacts likely; none likely to have been realised to date. | | | | | | |

Air Quality Action Plan Proposals

Air Quality Action Plan Proposals

PURPOSE OF THIS CONSULTATION

Aberdeen City Council declared part of the City Centre an Air Quality Management Area (AQMA) in June 2001. An Air Quality Action Plan (AQAP) was published in July 2006 outlining measures to improve air quality in the designated area. Two further AQMAs; one for the Anderson Drive/Haudagain roundabout corridor and Wellington Road (Queen Elizabeth Bridge/Balnagask Road) were declared in November 2008.

The Council has developed a new draft Air Quality Action Plan 2010 covering the three AQMAs. We would like to have your views on the proposals within our draft 2010 Plan. This leaflet summarises the key Actions.

The full draft Plan is available on the Council website and printed copies are available in the City's libraries or you can contact the Environmental Protection Team for a copy.

WHAT IS THE PROBLEM ?

Poor air quality is a widespread problem affecting many large cities, including Aberdeen. Elevated levels of pollutants such as nitrogen dioxide (NO₂) and particulate matter (PM₁₀) can impact on human health by aggravating existing respiratory and cardiovascular illness and other medical conditions, including asthma. Road traffic is the main source of the raised pollution levels in Aberdeen (90% of NOx emissions on Market Street and Haudagain roundabout are caused by road traffic), although domestic and commercial sources, including Aberdeen Harbour, contribute to the problem.

Monitoring and modelling of air quality has confirmed levels of NO, and PM, exceed national air quality objectives. The Council is required to produce and implement an Air Quality Action Plan that will improve the air quality in the three AQMAs.

Air Quality Action Plan Proposals

HOW DO I COMPLETE THE QUESTIONNAIRE ?

The Coundi's Draft 2010 Air Quality Action Plan outlines a number of measures aimed at reducing air pollution within the three AQMAs. This document summarises the key proposals within the Action Plan.

Please complete the questionnaire endosed including any comments you wish to have considered for inclusion in the Plan and return on the pre-printed FREEPOST address by **26 November 2010**.

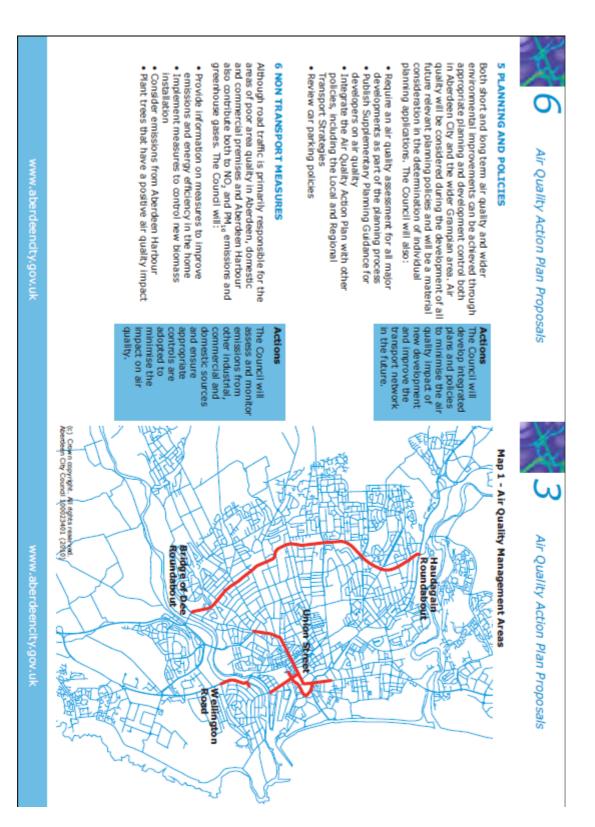

The consultation can also be completed online at:

1 MODAL SHIFT AND INFLUENCING TRAVEL CHOICE

a low number of residents use the bus, cycle or walk impact on health. Car ownership and use is high and through: in Aberdeen and that current pollution levels can Many people do not realise air quality is a problem The Council will promote and encourage modal shift

Increased awareness of air quality issues in

suondo improved travel shift by providing encourage modal quality issues and awareness of air increase public The Council will Actions

- Improved bus services Aberdeen
- Development of travel plans by businesses
- Improved cyding and walking provision
- Provision of car clubs/car pool schemes
 Provision of additional Park and Rides, including the
- A90 Charleston Interchange and Dyce

Aberdeen City Council Air Quality Action Plan 2011

2 LOWER EMISSIONS AND CLEANER VEHICLES

cut emissions from its own fleet where possible and WIII also: promote the uptake of greener vehicles. The Coundi can have an important role in reducing emissions. Hybrid, electric and other low polluting private vehicles The Council will, within the current economic dimate.

practice in the

- Consider the feasibility of a Low Emission Zone
- Undertake vehicle emission testing (LEZ) in the City Centre
- Undertake the enforcement of vehicle idling powers
- and provide "No Idling" street signage

WHAT IS A LOW EMISSIONS ZONE (LEZ) ?

A Low Emissions Zone (LEZ) is a geographically defined area where the most polluting vehicles are restricted, deterned or discouraged from access and use.

Air Quality Action Plan Proposals

3 ROAD INFRASTRUCTURE

pedestrianisation will improve air quality in the AQMAs as the Third Don Crossing, did not predict an overall several of the proposed infrastructure measures, such in greenhouse gas emissions. Air quality modelling of encourage greater car usage and cause an increase quality along new routes. Road building may also however this may be offset by a deterioration in air quality by the removal of traffic from congested areas, Western Peripheral Route (AWPR) and Union Street positive effect on air quality, however the Aberdeen The construction of new roads may improve air

> quality and improve air reduce congestion alterations that will building/junction consider road The Council will Actions

consider: partnership working, via existing Bus and Freight cars contribute significantly to congestion. Greater greatest proportion of emissions in Aberdeen, although Bus and freight vehicles are responsible for the **4 TRAFFIC MANAGEMENT** and improve air quality. The Council will additionally increase bus patronage, improve freight distribution Quality Partnerships have the potential to significantly

- HGV priority measures
- Development of a Commercial Vehicle Delivery Strategy (including the consideration of routing,
- High Occupancy Vehicle Lane on Stonehaven Road delivery restrictions and timing)

cleaner vehides. owners to operate businesses and car taxi operators, encourage bus and own fleet and operation of its purchase and demonstrate best The Council will Actions

> continue to develo flow and reduce its Intelligent operators. commercial vehicle with freight and improve links congestion and to improve traffic Transport System The Council will Actions
