Executive Summary: Air Quality in Our Area

Air Quality in Scottish Borders Council

Scottish Borders Council undertakes a programme of air quality assessment in accordance with the guidance produced by the UK Government and Devolved Administrations.

The Scottish Borders is located between Dumfries and Galloway in the west, South Lanarkshire and West Lothian in the north west, City of Edinburgh, East Lothian, Midlothian to the north, and the counties of Northumberland and Cumbria in England to the south.

Parts of the area have historically been heavily industrialised, although much of this has now gone and the area as a whole is predominantly rural. The main routes through the area are the A1, A68, and A7, and the East Coast Mainline railway.

This report sets out the results of air quality monitoring carried out by Scottish Borders Council since the last Annual Progress Report and considers the potential impacts from a range of sources such as road traffic and other transport emissions, industrial processes, commercial and domestic fuel use and fugitive emission sources.

There are no existing significant air quality issues identified within the area. Earlier rounds of review and assessment have identified only NO₂ from road traffic requiring to be considered, however there is no evidence that the annual mean concentration of NO₂ may exceed the specific Air Quality Objectives. In the Scottish Borders monitoring has shown concentrations of NO₂ to be relatively stable over recent years. A reduction in concentrations was seen during 2020 which was generally maintained in 2021, however this is expected to be as a result of the COVID-19 pandemic and associated restrictions on activity.

Scottish Borders Council has found no evidence that the levels of any other relevant pollutants may exceed the specific Air Quality Objectives and therefore has not identified the need to designate any Air Quality Management Areas.

Actions to Improve Air Quality

Scottish Borders Council is not currently engaged in any active air quality initiatives other than ongoing monitoring.

In June 2021 Scottish Borders Council agreed a Climate Change Route Map (CCRM) which sets a strategic direction for the Council and its partners and communities to move to a net zero economy by 2045, in line with the national target set by the Scottish Government. As the emissions that pollute our air and those that warm the planet have common sources: vehicles, buildings, power generation and industry, it is recognised that this strategy may result in a positive impact on air quality. In March 2022 full Council approved the 'Climate Change Route Map – Priority Action Plan 2022/24'. The priority actions respond to the Milestones identified within the themes of CCRM. Actions include a new Local Transport and Access Strategy, active travel Feasibility Studies to identify the infrastructure for active travel to be the natural first choice for our regions daily activities, and a bus network review.

Local Priorities and Challenges

Scottish Borders Council has no specific priorities or challenges for the coming year beyond the statutory monitoring and reporting requirements.

How to Get Involved

Members of the public can get involved in improving local air quality by taking alternative modes of transport where possible. This could include joining a cycle to work scheme, walking short distances instead of driving and when driving is unavoidable, taking part in car sharing schemes. Information on local transport can be obtained from the Scottish Borders Council website.

The Local Access and Transport Strategy promotes the use of electric vehicles. In the Scottish Borders we have a network of charging points for electric vehicles located throughout the area. Further information on the location of charging points is available on the Scottish Borders Council website.

Clean Air Day is a chance to find out more about air pollution, share information with others and help make the environment and air quality cleaner for everyone. Clean Air Day

Scottish Borders Council

took place in June 2022 and the Council promoted the day through its social media and internal channels. Further details can be found on the <u>Clean Air Day</u> campaign website.

Further information can also be obtained by contacting Environmental Health at: PLACEhealth@scotborders.gov.uk.

1 Local Air Quality Management

This report provides an overview of air quality in the Scottish Borders during 2021. It fulfils the requirements of Local Air Quality Management (LAQM) as set out in Part IV of the Environment Act (1995) and the relevant Policy and Technical Guidance documents.

The LAQM process places an obligation on all local authorities to regularly review and assess air quality in their areas, and to determine whether or not the air quality objectives are likely to be achieved. Where an exceedance is considered likely the local authority must declare an Air Quality Management Area (AQMA) and prepare an Air Quality Action Plan (AQAP) setting out the measures it intends to put in place in pursuit of the objectives. This Annual Progress Report (APR) summarises the work being undertaken by Scottish Borders Council to improve air quality and any progress that has been made.

Table 1.1 - Summary of Air Quality Objectives in Scotland

Pollutant	Air Quality Objective Concentration	Air Quality Objective Measured as	Date to be Achieved by
Nitrogen dioxide (NO ₂)	200 µg/m ³ not to be exceeded more than 18 times a year	1-hour mean	31.12.2005
Nitrogen dioxide (NO ₂)	40 μg/m³	Annual mean	31.12.2005
Particulate Matter (PM ₁₀)	50 μg/m³, not to be exceeded more than 7 times a year	24-hour mean	31.12.2010
Particulate Matter (PM ₁₀)	18 μg/m³	Annual mean	31.12.2010
Particulate Matter (PM _{2.5})	10 μg/m³	Annual mean	31.12.2021
Sulphur dioxide (SO ₂)	350 μg/m ³ , not to be exceeded more than 24 times a year	1-hour mean	31.12.2004
Sulphur dioxide (SO ₂)	125 μg/m ³ , not to be exceeded more than 3 times a year	24-hour mean	31.12.2004
Sulphur dioxide (SO ₂)	266 µg/m ³ , not to be exceeded more than 35 times a year	15-minute mean	31.12.2005
Benzene	3.25 μg/m ³	Running annual mean	31.12.2010
1,3 Butadiene	2.25 μg/m³	Running annual mean	31.12.2003
Carbon Monoxide	10.0 mg/m ³	Running 8-Hour mean	31.12.2003

2 Actions to Improve Air Quality

Air Quality Management Areas

Air Quality Management Areas (AQMAs) are declared when there is an exceedance or likely exceedance of an air quality objective. After declaration, the authority must prepare an Air Quality Action Plan (AQAP) within 12 months, setting out measures it intends to put in place in pursuit of the objectives.

Scottish Borders Council currently does not have any AQMAs.

Cleaner Air for Scotland 2

Cleaner Air for Scotland 2 – Towards a Better Place for Everyone (CAFS2) is Scotland's second air quality strategy. CAFS2 sets out how the Scottish Government and its partner organisations propose to further reduce air pollution to protect human health and fulfil Scotland's legal responsibilities over the period 2021 – 2026. CAFS2 was published in July 2021 and replaces Cleaner Air for Scotland – The Road to a Healthier Future (CAFS), which was published in 2015. CAFS2 aims to achieve the ambitious vision for Scotland "to have the best air quality in Europe". A series of actions across a range of policy areas are outlined, a summary of which is available on the Scottish Government's website.

Progress by Scottish Borders Council against relevant actions for which local authorities are the lead delivery bodies within this strategy is demonstrated below.

2.1.1 Placemaking – Plans and Policies

The benefits of a joined up approach to air quality and climate change policy areas are recognised. Air quality and climate change are inextricably linked, with air pollution often originating from the same activities that contribute to climate change. In September 2020, Scottish Borders Council agreed a series of recommendations contained within the report 'Responding to the Climate Emergency' which led to the Climate Change Route Map (CCRM) for the Scottish Borders being agreed by the Council in June 2021. This is available to view on the Scottish Borders Council website. The CCRM sets a strategic direction for the Council and its partners and communities to move to a net zero economy by 2045, in line with the national target set by the Scottish Government. Scottish Borders Council intends to lead by example by controlling its own estate in line with the aims and

objectives of the CCRM. It is hoped that this will motivate other individuals and organisations to do likewise.

The CCRM is based around 5 themes; Resilience, Transport Use, Nature Based Solutions, Energy and Waste Management. The CCRM is a new approach which will evolve and be populated with development work streams and action as progress is made. In March 2022 full Council approved the 'Climate Change Route Map – Priority Action Plan 2022/24'. The priority actions respond to the Milestones identified within the themes of CCRM. The Plan recognises that it would not be possible to deliver everything at the same pace or time, so an assessment has been undertaken to determine which actions should be prioritised over the next two years. Additional and subsequent actions will continue to be developed to add to and support the activity reflected in the Plan of Priority Actions, as this is a continually evolving and changing programme of action. Key developments will include the roll out of the Council's Place Making Programme.

We will seek to ensure air quality considerations are part of decision making.

2.1.2 Transport – Low Emission Zones

Local authorities working with Transport Scotland and SEPA will look at opportunities to promote zero-carbon city centres within the existing LEZs structure. At this time Scottish Borders Council has no plans to introduce Low Emission Zones.

Scottish Borders Council has produced a Local Access and Transport Strategy which is available on the <u>Scottish Borders Council</u> website. This strategy is currently being updated, and alongside the ESESCR (Edinburgh and South East Scotland City Region Deal) Workforce Mobility project, will form the Council's approach to travel planning.

2.1.3 Local Development Plan

The Scottish Government is reviewing its national planning policies, National Planning Framework 3 (NPF3) and Scottish Planning Policy (SPP), with a view to bringing them together into a single policy document National Planning Framework 4 (NPF4). The Planning (Scotland) Act 2019 requires that the revised National Planning Framework has regard to any national strategy in respect of the improvement of air quality prepared by Scottish ministers. Scottish Borders Council will ensure the Local Development Plan is updated in accordance with the principles of NPF4.

Scottish Borders Council

The Scottish Borders Council Local Development Plan recognises the area's good air quality and our aim to maintain this standard. The Plan is founded on the premise of supporting and encouraging sustainable development in accordance with the Council's environmental strategy and the need for action on climate change. In determining planning applications and preparing document briefs, the Council has regard to sustainability principles, including the preservation of air quality, which underpin all the Plan's policies and which developers will be expected to incorporate into their developments.

Development proposals that, individually or cumulatively, could adversely affect the quality of air in a locality to a level that could potentially harm human health and wellbeing or the integrity of the natural environment, must be accompanied by provisions that the Council is satisfied will minimise such impacts to an acceptable degree. Where it is considered appropriate the council may request that an Air Quality Assessment is undertaken to assist determination of an application

The Scottish Borders is a largely rural area with significant remoteness, resulting in a high number of households that have access to a car. Transport policies seek to promote the most sustainable means of travel, giving priority to walking and cycling for local journeys, and to public transport in preference to travel by car.

The Local Development Plan is available on the Scottish Borders Council website.

3 Air Quality Monitoring Data and Comparison with Air Quality Objectives

Summary of Monitoring Undertaken

This section sets out the monitoring that has taken place and how local concentrations of the main air pollutants compare with the objectives.

During 2021 no changes took place to the air quality monitoring carried out by Scottish Borders Council, however a review has been carried out and changes to the NO₂ monitoring locations have been proposed.

3.1.1 Automatic Monitoring Sites

In the Scottish Borders automatic (continuous) monitoring for NO₂ and O₃ was undertaken at one site in Peebles during 2021. This was part of the Automatic Urban and Rural Network (AURN). Table A.1 in Appendix A shows the details of the site. National monitoring results are available at https://www.scottishairquality.scot/latest.

A map showing the location of the monitoring site is provided in Appendix D. Further details on how the monitors are calibrated and how the data has been adjusted are included in Appendix C.

3.1.2 Non-Automatic Monitoring Sites

Scottish Borders Council undertook non-automatic (passive) monitoring of NO₂ at 3 sites during 2021. Table A.2 in Appendix A shows the details of the sites.

During 2020 monitoring was not carried out at location DT12 due to building renovation work. Unfortunately the issue with this site continued into 2021 resulting in no results being reported. We are confident this issue has now been resolved and results for 2022 will be reported in the 2023 Annual Progress Report.

Maps showing the location of the monitoring sites are provided in Appendix D. Further details on Quality Assurance/Quality Control (QA/QC) and bias adjustment for the diffusion tubes are included in Appendix C.

Since the last Annual Progress Report a review of NO₂ monitoring locations has been undertaken. The last review was undertaken in 2017 when the number of monitoring locations was reduced from fourteen to four.

The four current monitoring sites were introduced on *High Street, Galashiels* in 2006 in order to assess the impact of the new A7 inner relief road. The Inner Relief Road resulted in a significant reduction in NO₂ concentrations and the Council has continued to monitor at these four locations since. Monitoring in recent years has shown concentrations have remained relatively stable, with 2019 concentrations ranging from 17-21µg/m³ across the locations. There was a reduction in concentrations in 2020, however this was assumed to be as a result of the COVID-19 pandemic and associated restrictions on activity. Levels in 2021 remained at similar levels to those in 2020.

The Council recognises that long term monitoring is important for trend analysis to monitor improvements or worsening of air quality in the area, even where limit values are being met, however the review has determined that four locations on *High Street, Galashiels* are no longer required. *High Street, Galashiels* is still considered to be a "hotspot" due to its busy town centre location and canyon-like street, and therefore we propose to reduce the number of locations by two.

We have considered other "hotspots" and propose to re-commence monitoring on *High Street, Hawick* at two locations, although based on the results of previous monitoring no exceedance of the objective is envisaged. Hawick, like Galashiels, is a principal town and has a canyon-like High Street which is a main traffic route through the town with relevant exposure. *High Street, Hawick* was last monitored in 2016 with results of 19µg/m³.

In summary, we propose to (1) reduce the number of monitoring locations on *High Street, Galashiels* by two and (2) introduce two monitoring locations on *High Street, Hawick*.

Consultation on the proposed changes has been carried out with the Scottish Government and SEPA. The Scottish Government reported they are content with the proposed changes and SEPA provided its support to the reintroduction of monitoring on *High Street, Hawick*.

Scottish Borders Council intends to implement these changes in January 2023.

3.1.3 Other Monitoring Activities

No further monitoring activities were undertaken during 2021.

Individual Pollutants

The air quality monitoring results presented in this section are, where relevant, adjusted for annualisation and bias. Further details on adjustments are provided in Appendix C.

3.1.4 Nitrogen Dioxide (NO₂)

Table A.3 in <u>Appendix A</u> compares the ratified and adjusted monitored NO₂ annual mean concentrations for the past five years with the air quality objective of 40 μg/m³. The full 2021 dataset of monthly mean values is provided in <u>Appendix B</u>.

The 2021 annual mean concentrations of NO₂ at all diffusion tube monitoring locations are shown to be well within the air quality objective, with the highest concentration recorded being 16µg/m³ at location DT14.

Results of non-automatic monitoring over the last five years have shown no exceedances of the NO₂ objective. The annual mean concentrations were relatively stable at all locations prior to 2020, when there was an average reduction of 5µg/m³ compared to concentrations recorded in 2019. This reduction was maintained in 2021, with the exception of location DT13 which saw an increase of 2µg/m³ compared to 2020. This is illustrated in Figure A.1. These monitoring locations are within a town centre kerbside location, therefore it is assumed the reduction in concentrations is a result of the reduction in vehicle movements due to COVID-19 and the associated restrictions on activity from March 2020. Restrictions on activity eased as the year progressed, however a further lockdown was imposed in January 2021, which continued until April 2021.

The annual mean concentration of NO_2 at the automatic monitoring site (CM1) has also been very stable over the past 5 years, ranging from 4-6 μ g/m³ between 2017 and 2021. As the automatic monitoring site is classified as urban background, and is distanced from sources, this location was impacted to a lesser extent by COVID-19 and the associated restrictions on activity.

Table A.4 in Appendix A compares the ratified continuous monitored NO₂ hourly mean concentrations for the past five years with the air quality objective of 200µg/m³, not to be

exceeded more than 18 times per year. No exceedances were identified in 2021, or indeed within the last five years.

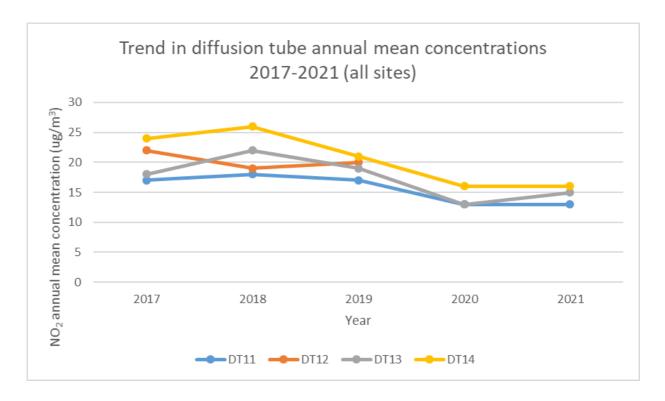

Figure A.1 - Trend in diffusion tube measured annual mean 2016-2021 (all sites)

Measurement of NO₂ will continue using the diffusion tube method to monitor the ongoing trends in NO₂ concentrations.

3.1.5 Particulate Matter (PM₁₀)

Scottish Borders Council currently does not monitor PM₁₀ and has no plans to do so in the future.

3.1.6 Particulate Matter (PM_{2.5})

Scottish Borders Council currently does not monitor PM_{2.5} and has no plans to do so in the future.

3.1.7 Sulphur Dioxide (SO₂)

Scottish Borders Council currently does not monitor SO₂ and has no plans to do so in the future.

3.1.8 Carbon Monoxide, Lead and 1,3-Butadiene

Scottish Borders Council currently does not monitor Carbon Monoxide, Lead or 1,3-Butadiene and has no plans to do so in the future.

3.1.9 Ozone (O₃)

Automatic (continuous) monitoring for O_3 was undertaken at one site in Peebles during 2021 as part of the Automatic Urban and Rural Network (AURN). The results have been compared with the Air Quality Strategy Objective running 8-hour mean which states the running 8-hour mean should not exceed $100\mu g/m^3$ on more than 10 days per year. No exceedances were identified in 2021, or indeed within the last five years.

4 New Local Developments

No new developments in the area that may affect air quality have been identified.

Road Traffic Sources

No new road traffic sources have been identified.

Other Transport Sources

No new other transport sources have been identified.

Industrial Sources

Scottish Borders Council consulted SEPA in order to identify any new industrial installations, or any existing installations which have increased substantially. No new, or substantially changed, industrial sources which might impact on local air quality have been identified.

Commercial and Domestic Sources

During 2021 there were a number of planning applications in respect of new biomass boilers and stoves. These are routinely screened using the approved Screening Tool and no installations have been identified as impacting adversely on local air quality.

New Developments with Fugitive or Uncontrolled Sources

No new potential sources of fugitive or uncontrolled particulate matter have been identified.

5 Planning Applications

The Council continues to assess the impact of proposed developments. The following developments may either be of significance in respect of local air quality or be a proposed development where air quality is a consideration.

• An air quality impact assessment was submitted in relation to a planning application for a proposed grain distillery on land at Charlesfield Industrial Estate, St Boswells. The assessment considered baseline air quality, construction impacts and operational impacts. With regards to traffic impacts, a review of available information concluded an assessment was not necessary, however a detailed assessment was carried out in relation to emissions from the site. The assessment considered key pollutants as emitted from the combined heat and power unit and steam boilers, and concluded there to be no predicted exceedances of relevant environmental standards at the proposed stack height.

The application was approved in October 2021. Further information can be found on the Scottish Borders Council website.

Scottish Borders Council is currently considering an application for the replacement
of Galashiels Academy; an air quality impact assessment accompanies the
application. The assessment considers the potential impacts associated with an
increase in traffic upon existing sensitive receptors within the area and concludes
no exceedances of relevant AQSs for NO₂, PM₁₀ and PM_{2.5} are predicted.
 Further information can be found on the Scottish Borders Council website.

No other major Planning Applications have been identified which may impact on local air quality.

6 Conclusions and Proposed Actions

Conclusions from New Monitoring Data

The monitoring undertaken by Scottish Borders Council has not identified any potential or actual exceedances of the Air Quality Objectives at any relevant locations. Analysis of NO₂ concentrations between 2017 and 2021 show NO₂ concentrations follow a relatively stable trend. A reduction in concentrations was seen during 2020 which was generally maintained in 2021, however this is expected to be as a result of the COVID-19 pandemic and associated restrictions on activity.

Conclusions relating to New Local Developments

A review has identified no new developments which might impact on local air quality.

Proposed Actions

Scottish Borders Council will continue to carefully consider future planning applications which may have the potential to impact on air quality.

Previous annual progress reports proposed a review of the current monitoring locations due to there being no formal review since 2017. This review resulted in the number of monitoring locations being reduced from fourteen to four. A recent review has been carried out which is detailed in Section 3.1.2, however in summary we propose the following:

- (1) reduce the number of monitoring locations on *High Street, Galashiels* by two; and
- (2) re-introduce monitoring on *High Street, Hawick* at two locations.

This review has been carried out in consultation with the Scottish Government and SEPA. We also propose to explore the use of other monitoring approaches e.g. low-cost sensors, as suggested by SEPA in their consultation response.

The results of air quality monitoring and other air quality work will be included in the 2023 Annual Progress Report.

Appendix A: Monitoring Results

Table A.1 – Details of Automatic Monitoring Sites

Site ID	Site Name	Site Type	X OS Grid Ref	Y OS Grid Ref	Pollutants Monitored	In AQMA? Which AQMA?	Monitoring Technique	Distance to Relevant Exposure (m)	Distance to kerb of nearest road (m) (2)	Inlet Height (m)

- (1) 0m if the monitoring site is at a location of exposure (e.g. installed on/adjacent to the façade of a residential property).
- (2) N/A if not applicable.

Table A.3 – Annual Mean NO₂ Monitoring Results (μg/m³)

Site ID	Site Type	Monitoring Type	Valid Data Capture for Monitoring Period (%) (1)	Valid Data Capture 2021 (%) ⁽²⁾	2017	2018	2019	2020	2021
CM1	Urban background	Automatic	-	81	5	6	6	4	5
DT11	Kerbside	Diffusion Tube	-	92	17	18	17	13	13
DT12	Kerbside	Diffusion Tube	-	-	22	19	20	-	-
DT13	Kerbside	Diffusion Tube	-	100	18	22	19	13	15
DT14	Kerbside	Diffusion Tube	-	100	24	26	21	16	16

Exceedances of the NO₂ annual mean objective of 40µg/m³ are shown in bold.

NO₂ annual means exceeding 60µg/m³, indicating a potential exceedance of the NO₂ 1-hour mean objective are shown in **bold and underlined**.

Means for diffusion tubes have been corrected for bias. All means have been "annualised" as per LAQM.TG(16) if valid data capture for the full calendar year is less than 75%. See Appendix C for details.

- (1) Data capture for the monitoring period, in cases where monitoring was only carried out for part of the year.
- (2) Data capture for the full calendar year (e.g. if monitoring was carried out for 6 months, the maximum data capture for the full calendar year is 50%).
- (-) No data available for monitoring period.

Table A.4 – 1-Hour Mean NO₂ Monitoring Results, Number of 1-Hour Means > 200μg/m³

Site	ID Site Type	Monitoring Type	Valid Data Capture for Monitoring Period (%) (1)	Valid Data Capture 2021 (%) ⁽²⁾	2017	2018	2019	2020	2021
CM	1 Urban Background	Automatic	-	81	0	0	0	0	0

Exceedances of the NO₂ 1-hour mean objective (200 µg/m³ not to be exceeded more than 18 times/year) are shown in bold.

If the period of valid data is less than 85%, the 99.8th percentile of 1-hour means is provided in brackets.

- (1) Data capture for the monitoring period, in cases where monitoring was only carried out for part of the year.
- (2) Data capture for the full calendar year (e.g. if monitoring was carried out for 6 months, the maximum data capture for the full calendar year is 50%).

Table A.5 – 8-Hour Mean O₃ Monitoring Results, Number of 8-Hour Means > 100µg/m³

3 11 15	3 11 11		Valid Data Capture 2021	Number of 8-hour Means > 100 μg/m³

CM1	Peebles	Urban Background	99	0	0	0	0	0		

Exceedances of the O₃ objective are shown in red and bold.

(1) Data capture for the full calendar year (e.g. if monitoring was carried out for 6 months, the maximum data capture for the full calendar year is 50.

Appendix B: Full Monthly Diffusion Tube Results for 2021

Table B.1 - NO₂ 2021 Monthly Diffusion Tube Results (µg/m³)

Site ID	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual Mean: Raw Data	Annual Mean: Bias Adjusted ⁽¹⁾
DT11	22.8	15.6	10	15.3	12.4	10.8	11.5	-	13.3	14.1	16.1	17	14.45	12.57
DT12	-	-	-	-	•	-	-	-	-	-	•	-	-	-
DT13	22.4	16.5	13.9	17.4	16.8	13.2	14.5	13.2	18.5	19.4	18.9	20.3	17.08	14.86
DT14	21.8	21.1	14.3	15.4	17.5	14.2	17.4	11.1	18.1	19.9	20.9	23.6	17.94	15.61

Notes:

- (1) See Appendix C for details on bias adjustment.
- (-) No date available for monitoring period.

Appendix C: Supporting Technical Information / Air Quality Monitoring Data QA/QC

New or Changed Sources Identified Within Scottish Borders Council During 2021

Scottish Borders Council has not identified any new sources relating to air quality within the reporting year of 2021.

Additional Air Quality Works Undertaken by Scottish Borders Council During 2021

Scottish Borders Council has not completed any additional works within the reporting year of 2021.

QA/QC of Diffusion Tube Monitoring

All diffusion tubes used by the Council are mounted and handled in accordance with the guidance contained in LAQM (TG16). Sites have been selected in consultation with the Scottish Government and SEPA to be representative of human exposure.

The laboratory used for the analysis of the Council's diffusion tubes was Edinburgh Scientific Services. The laboratory is United Kingdom Accreditation Service (UKAS) accredited and is listed as 'satisfactory' in the AIR NO₂ Proficiency Testing Scheme. The analytical method of 50% TEA in Acetone is used.

Monitoring has been completed in adherence with the 2021 Diffusion Tube Monitoring Calendar.

In accordance with Chapter 7 of the LAQM Technical Guidance (TG16) the results have been reviewed for erroneous data. A result of <1µg/m³ at location DT11 in August 2021 has been identified as erroneous and removed.

Diffusion Tube Annualisation

All diffusion tube monitoring locations within Scottish Borders Council recorded data capture of 75% therefore it was not required to annualise any monitoring data.

Diffusion Tube Bias Adjustment Factors

Scottish Borders Council has applied a national bias adjustment factor of 0.87 to the 2021 monitoring data. One study is applicable to this factor. Supporting evidence is provided in Figure C.1 in the form of a screen capture from the National Diffusion Tube Bias Adjustment Spreadsheet (Version 3/22). A summary of bias adjustment factors used by Scottish Borders Council over the past five years is presented in Table C.1.

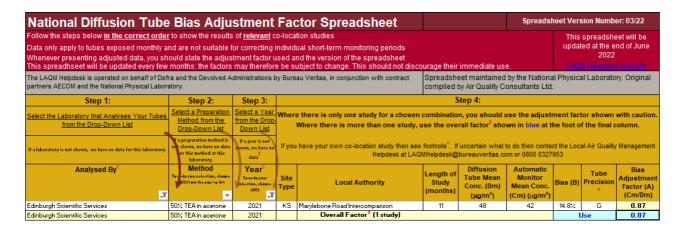

Figure C.1 – Screen capture of National Diffusion Tube Bias Adjustment Spreadsheet

Table C.1 – Bias Adjustment Factor

Year	Local or National	If National, Version of National Spreadsheet	Adjustment Factor
2021	National	03/22	0.87
2020	National	03/21	0.88
2019	National	03/20	0.87
2018	National	03/19	0.96
2017	National	03/18	0.89

NO₂ Fall-off with Distance from the Road

No diffusion tube NO₂ monitoring locations within Scottish Borders Council required distance correction during 2021.

QA/QC of Automatic Monitoring

The QA/QC work on the Peebles site is carried out under the auspices of the Automatic Urban and Rural Network (AURN) system. Routine calibrations are undertaken every four weeks by Council Staff as Local Site Operatives.

Data validation and ratification is undertaken by Bureau Veritas, Contractors appointed by DEFRA/Scottish Government.

Site audits are undertaken at regular intervals by AEA Technology and no significant issues were identified in 2021.

Live and historic monitoring data is available on the Air Quality in Scotland website (http://www.scottishairquality.scot/).

Automatic Monitoring Annualisation

All automatic monitoring locations within Scottish Borders recorded data capture of greater than 75% therefore it was not required to annualise any monitoring data.

NO₂ Fall-off with Distance from the Road

No automatic NO₂ monitoring locations within Scottish Borders required distance correction during 2021

Appendix D: Location of monitoring sites

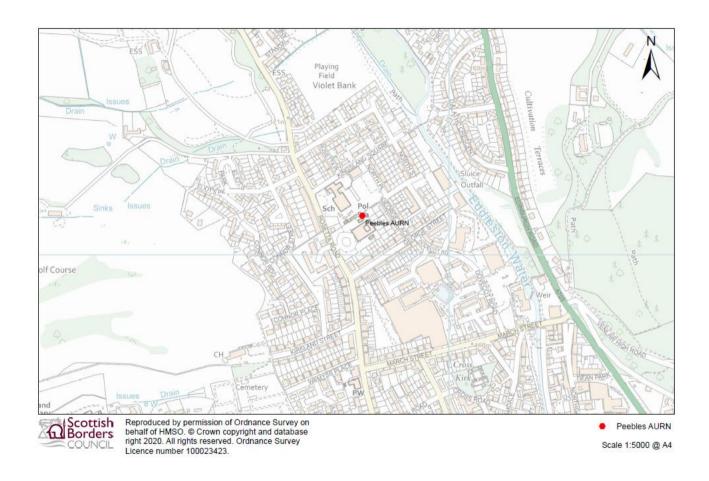

Figure D.1 – Map showing location of automatic monitoring site (AURN)

Scottish Borders Council

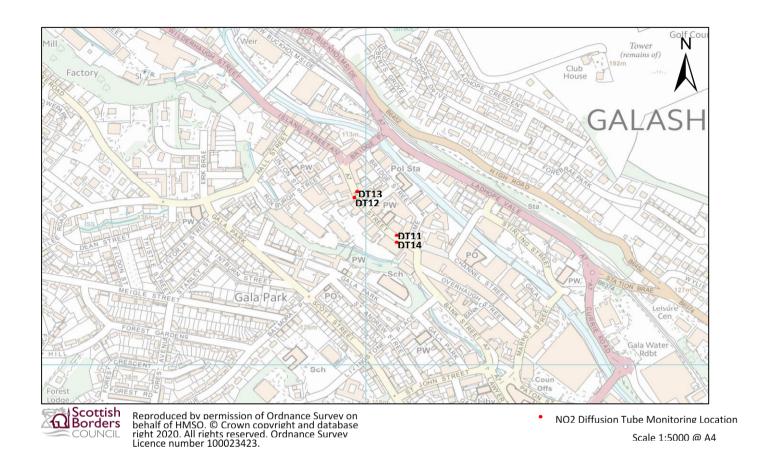

Figure D.2 – Map showing location of diffusion tube monitoring site

Glossary of Terms

Abbreviation	Description
AQAP	Air Quality Action Plan - A detailed description of measures, outcomes, achievement dates and implementation methods, showing how the LA intends to achieve air quality limit values'
AQMA	Air Quality Management Area – An area where air pollutant concentrations exceed / are likely to exceed the relevant air quality objectives. AQMAs are declared for specific pollutants and objectives
APR	Air quality Annual Progress Report
AURN	Automatic Urban and Rural Network (UK air quality monitoring network)
CCRM	Climate Change Route Map for the Scottish Borders
Defra	Department for Environment, Food and Rural Affairs
DMRB	Design Manual for Roads and Bridges – Air quality screening tool produced by Highways England
FDMS	Filter Dynamics Measurement System
LAQM	Local Air Quality Management
NO ₂	Nitrogen Dioxide
NOx	Nitrogen Oxides
03	Ozone
PM ₁₀	Airborne particulate matter with an aerodynamic diameter of 10µm (micrometres or microns) or less
PM _{2.5}	Airborne particulate matter with an aerodynamic diameter of 2.5µm or less
QA/QC	Quality Assurance and Quality Control
SO ₂	Sulphur Dioxide
